## TECHNICAL MEMORANDUM

To: Greg Tsujiuchi and Lisa Kranitz, City of Gardena  
From: Olivia Chan and Rita Garcia, Kimley-Horn  
Date: August 18, 2023  
Subject: **Air Quality Technical Report Normandie Crossing Specific Plan Project, California Peer Review**

---

Kimley-Horn has conducted a follow-up third-party peer review of the Project's Air Quality Technical Report (Ramboll US Consulting, Inc., July 2023) on behalf of the City of Gardena to verify that Kimley-Horn's March 7, 2023 third-party peer review Technical Memo (TM) recommendations and Project updates have been incorporated. The revised July 2023 report does not incorporate the recommendations made in the peer review TM. However, the analysis, as revised, meets the applicable provisions of CEQA and the State CEQA Guidelines and is adequate for inclusion in the Project EIR.

Please do not hesitate to contact Olivia Chan at 714.939.1030 or [olivia.chan@kimley-horn.com](mailto:olivia.chan@kimley-horn.com) with any questions.

## EXECUTIVE SUMMARY

The Normandie Crossing Specific Plan Project (the “Project”) is a proposed residential development in the City of Gardena that involves the demolition of the existing industrial buildings, and construction of a new multi-family residential housing building with 403 dwelling units. The Project site is located on a 5.25-acre parcel at 16911 and 16831 S Normandie Avenue, Gardena, California. The proposed Project is expected to be built out by 2027, with construction beginning in 2024.

This report evaluates the air quality impacts associated with the construction and operation of the proposed Project. The proposed Project will result in emissions of criteria air pollutants (CAPs), such as nitrogen oxides ( $\text{NO}_x$ ), carbon dioxide (CO), volatile organic compounds (VOC), sulfur oxides ( $\text{SO}_x$ ), and particulate matter (PM) with an aerodynamic radius less than 10 micrometers ( $\text{PM}_{10}$ ) or less than 2.5 micrometers ( $\text{PM}_{2.5}$ ) during both construction and operation.

Ramboll US Consulting, Inc. (Ramboll) used the California Emission Estimator Model (CaLEEMod®) version 2020.4.0 program to develop CAP emission inventories for the proposed Project and the South Coast Air Quality Management District’s (SCAQMD’s) mass-based Localized Significance Thresholds (LSTs) to evaluate ambient air impacts associated with construction of the proposed Project.

**Table ES-1** presents the maximum daily CAP emissions associated with Project construction. As shown in **Table ES-1**, emissions of all CAPs are less than SCAQMD’s mass daily significance thresholds. Hence, the air quality impacts of maximum daily CAP emissions from Project construction would be less than significant. The proposed Project will comply with SCAQMD Rule 403 to minimize fugitive dust, which will include fugitive dust control by watering active construction areas.

**Table ES-2** presents the maximum daily criteria air pollutant emissions associated with Project operation. The primary source of the operational CAP emissions (except VOC) is traffic-related mobile sources. As shown in **Table ES-2**, emissions of all CAPs for the proposed Project (full buildout operations minus the existing conditions) are less than SCAQMD’s mass daily significance thresholds. Hence, air quality impacts of the maximum daily CAP emissions from Project operation would be less than significant.

The localized air quality impacts of Project construction activities were evaluated using SCAQMD’s LST methodology. **Table ES-3** presents a comparison of the Project-related emissions from on-site construction and operational activities to the applicable LSTs. Emissions from construction and operational activities were estimated based on conservative assumptions to represent the maximum level of activity that may occur on the Project Site. Furthermore, the LST analysis assumes that the maximum daily emissions would occur during the worst-case meteorological conditions, which is not likely. As shown in **Table ES-3**, Project-related on-site construction and operational emissions would not result in an exceedance of LSTs for nitrogen dioxide ( $\text{NO}_2$ ), CO,  $\text{PM}_{10}$ , and  $\text{PM}_{2.5}$  standards. Therefore, the Project’s contribution to the localized air concentrations of these pollutants would be less than significant.

## 1. INTRODUCTION

The purpose of this technical report is to present the quantitative analyses that were used to evaluate the Project's air quality emissions. Emissions during both construction and operations of the proposed Project were quantified. In addition, the localized criteria pollutant concentrations were evaluated using the mass-based Localized Significance Thresholds (LSTs) to evaluate ambient air impacts associated with construction of the proposed Project.

### 1.1 Project Description

The Normandie Crossing Specific Plan Project (the "Project") is a proposed residential development in the City of Gardena, California that involves the demolition of the existing industrial buildings, and construction of new multi-family residential housing with 403 dwelling units. The Project site is located on a 5.25-acre parcel at 16911 and 16831 S Normandie Avenue, Gardena, California. The proposed Project is expected to be built out by 2027, with construction beginning in 2024. **Table 1** summarizes the land uses for the proposed Project.

Analysis of the proposed Project's air quality emissions incorporates the following regulatory measures:

#### ***Regulatory Measures***

##### Construction

- Compliance with SCAQMD Rule 403 regarding fugitive dust. The construction emission estimates include a fugitive dust control factor of 55% (equivalent to watering two times per day), which is a conservative representation of the level of fugitive dust control expected through compliance with South Coast Air Quality Management District (SCAQMD) Rule 403.
- Compliance with SCAQMD Rule 1113 regarding Architectural Coatings. This rule limits the volatile organic compound (VOC) content of architectural coatings used in the SCAQMD. The rule provides various standards for the coating category. California Emission Estimator Model (CalEEMod®) includes assumptions regarding the requirements of SCAQMD Rule 1113 (amended February 5, 2016).<sup>1</sup>

##### Operational

- Compliance with SCAQMD Rule 445 regarding Wood-Burning Devices. This rule limits the installation of wood-burning devices into any new development. Therefore, all cooking stoves are assumed to be natural gas burning. The dwelling units will not have fireplaces.
- New residential buildings will meet the 2022 Title 24 Part 6 building code.

---

<sup>1</sup> Available at: <http://www.aqmd.gov/docs/default-source/rule-book/reg-xi/r1113.pdf>. Accessed: December 2022.

### ***Project Design Features***

The following project design features were qualitatively and quantitatively incorporated into the analysis:

#### Construction

- The Project will utilize off-road diesel-powered construction equipment which shall meet, at a minimum, the Tier 4 emission standards for nonroad diesel engines promulgated by the USEPA for equipment greater than 50 horsepower.<sup>2</sup>

#### Operational

- The proposed Project will comply with California Green Building Standards Code, Title 24, Part 11, of the California Code of Regulations for electric vehicle (EV) charging design. This is anticipated to provide 10% of parking stalls to be EV capable, 25% of parking stalls to be EV ready with Level 2 EV charging receptacles, and 5% of parking stalls to be equipped with Level 2 EV chargers. The exact design may vary from this in compliance with the California Green Building Standards Code.<sup>3</sup>
- There will be no natural gas use by any of the Project land uses.<sup>4</sup>

## **1.2 Existing Conditions**

Existing land uses within the Project site include industrial buildings and surface parking lot.

**Table 2** lists the existing land use and building square footages. The criteria pollutant emissions from the existing land use were estimated using CalEEMod® as described in Section 3 and are shown in **Table ES-2**.

---

<sup>2</sup> This measure was quantified within the Project construction emissions inventory.

<sup>3</sup> This measure was not quantified but has been included here qualitatively.

<sup>4</sup> This measure was quantified within the Project operational emissions inventory.

## 2. SIGNIFICANCE THRESHOLDS

The SCAQMD has established significance thresholds<sup>5</sup> to assess the impacts of project-related construction and operational emissions on regional and local ambient air quality. **Table 3** shows the mass daily thresholds for construction and operations as adopted by the SCAQMD for criteria pollutant emissions evaluated in this analysis. The analysis summarized in this report estimates project-related construction and operational mass emissions and compares the emissions to these mass daily significance thresholds. This report also compares the ambient air quality impacts from on-site construction and operational activities to the state and local ambient air quality standards, for which the SCAQMD has established Localized Significance Thresholds (LSTs).<sup>6</sup> LSTs represent the maximum emissions from a project that are not expected to cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standard. The LST emission levels are presented in **Table 3**.

## 3. CRITERIA POLLUTANT EMISSION INVENTORIES

This section describes the methodology that Ramboll US Consulting, Inc. (Ramboll) used to develop the criteria pollutant emissions inventories associated with the proposed Project, which include construction and operational emissions. Sub-categories of the operational emissions include: area sources, energy use, and mobile sources.

### 3.1 Methodology for Calculating Mass Emissions

This analysis focuses on the potential change in air quality due to implementation of the proposed Project. The proposed Project would result in criteria pollutant emissions from construction and operational sources. Construction activities would generate emissions at the site from on-site construction equipment, and on roadways resulting from construction-related truck hauling, vendor deliveries, and worker commuting. Operational activities would also generate emissions at the Project site from miscellaneous on-site sources, such as natural gas combustion for cooking and comfort heating and landscaping equipment, and off-site from operational-related traffic.

To estimate the criteria pollutant emissions from the proposed Project, Ramboll directly or indirectly relied primarily on emissions estimation guidance from government-sponsored organizations, the transportation study by Fehr & Peers Transportation Consultants, and emission estimation software.

#### **CalEEMod®**

Ramboll primarily utilized the California Emission Estimator Model version 2020.4.0 (CalEEMod®)<sup>7</sup> to assist in quantifying the criteria air pollutant emissions in the inventories presented in this report for the proposed Project. CalEEMod® is a state-wide program designed to calculate both criteria and greenhouse gas (GHG) emissions from development projects in California.

CalEEMod® is based upon California Air Resources Board (ARB) approved Off-Road and On-Road Mobile-Source Emission Factor models (OFFROAD and EMFAC, respectively), and is designed to estimate construction and operational emissions for land use development projects and allows for the input of project-specific information. OFFROAD2011<sup>8</sup> is an emissions factor model used in CalEEMod® to calculate emission rates from off-road mobile sources (e.g., construction equipment, agricultural equipment). EMFAC2017<sup>9</sup> is the emissions factor model used in CalEEMod® to calculate emissions rates from on-road vehicles (e.g., passenger vehicles, haul trucks).

CalEEMod® provides a simple platform to calculate both construction emissions and operational emissions from a land use project. It calculates both the maximum daily and annual average emissions for criteria air pollutants as well as total or annual GHG emissions. The model also provides default values for water and energy use.

<sup>7</sup> CAPCOA. 2021. California Emissions Estimator Model. Version 2020.4.0. Available at: <http://www.caleemod.com/>. Accessed: December 2022.

<sup>8</sup> ARB. Overview: OFFROAD Model. Available at: [https://www.arb.ca.gov/msei/offroad/pubs/offroad\\_overview.pdf](https://www.arb.ca.gov/msei/offroad/pubs/offroad_overview.pdf). Accessed: December 2022.

<sup>9</sup> ARB. 2017. EMFAC2017 Volume I - User's Guide. Available at: <https://www.arb.ca.gov/msei/downloads/emfac2017-volume-i-users-guide.pdf>. Accessed: December 2022.

CalEEMod® contains default values and existing regulatory methodologies to use in each specific local air district region. Appropriate statewide default values can be utilized if regional default values are not defined. Ramboll used default factors for Los Angeles - South Coast County area that is within the SCAQMD jurisdiction for the emission inventory, unless otherwise noted in the methodology descriptions below. Details regarding the specific methodologies used by CalEEMod® can be found in the CalEEMod® User's Guide and associated appendices.<sup>10</sup> The CalEEMod® output files are provided for reference in **Appendix A** to this report.

### **3.2 Construction Emissions**

This section describes the estimation of emissions from construction activities at the Project site. The major construction phases for the proposed Project included in this analysis are:

- Demolition: involves tearing down of the existing buildings on the Project site.
- Site Preparation: involves clearing vegetation (grubbing and tree/stump removal) and stones prior to grading.
- Grading: involves the cut and fill of land to ensure the proper base and slope for the construction foundation.
- Building Construction: involves the construction of structures and buildings.
- Architectural Coating: involves the application of coatings to both the interior and exterior of buildings or structures.
- Paving: involves the laying of concrete or asphalt such as in parking lots or roads.

Emissions from these construction phases are largely attributable to fuel use from construction equipment and worker commuting.

Construction-related emissions of reactive organic gases (ROGs), NO<sub>x</sub>, CO, PM<sub>10</sub>, and PM<sub>2.5</sub> were estimated using CalEEMod®. PM emissions are composed of exhaust emissions and fugitive emissions. Exhaust emissions are typically given out by a combustion engine of on-road vehicles and/or off-road equipment. Fugitive emissions are PM dust suspended in the air by wind action and construction-related activities.

Ramboll was provided with a construction start date and phase durations and relied upon CalEEMod® defaults to estimate the phasing schedule and numbers and types of equipment that will be used in each construction phase (i.e., demolition, grading) of the proposed Project. The number of worker and vendor vehicle trips are based on project-specific data. The number of hauling trips are based on CalEEMod® defaults estimated based on project-specific grading material movement and demolition waste volumes. The emission calculations are intended to estimate maximum daily emissions. Each piece of equipment was assumed to operate based on CalEEMod® default assumptions (i.e., load factor and operational hours). The construction is expected to commence in 2024 and is anticipated to be completed in 2027. The construction schedule, grading volumes, demolition waste volumes, and construction trip information are shown in **Table 4**, **Table 5**, **Table 6**, and **Table 7**, respectively. Construction emissions are estimated assuming one shift working up

---

<sup>10</sup> SCAQMD. 2021. California Emissions Estimator Model User's Guide. Version 2020.4.0. Available at: <http://www.caleemod.com/>. Accessed: December 2022.

to 8 hours per day, for six days in a week. The CalEEMod® output files are included in **Appendix A**.

### **3.2.1 Emissions from Construction Equipment**

The emission calculations associated with construction equipment are from off-road equipment engine use based on the assumptions summarized above. The fugitive emissions from off-road equipment performing work are also included in this analysis.

Since the majority of the off-road construction equipment used for construction projects are diesel fueled, CalEEMod® assumes all of the equipment operates on diesel fuel. The calculations associated with on-site construction equipment include the running exhaust emissions from off-road equipment. Since the equipment is assumed to be diesel, there are no starting or evaporative emissions associated with the equipment as these are de minimis for diesel-fueled equipment. CalEEMod® calculates the exhaust emissions based on CARB's OFFROAD2011 methodology using the equation presented below.<sup>11</sup>

$$Emissions_{Diesel} = \sum_i (EF_i \times Pop_i \times AvgHP_i \times Load_i \times Activity_i)$$

Where:

EF:	Emission factor in grams per horsepower-hour (g/bhp-hr) as processed from OFFROAD2011
Pop:	Population, or the number of pieces of equipment
AvgHP:	Maximum rated average horsepower
Load:	Load factor
Activity:	Hours of operation
i:	Equipment type

CalEEMod® was also used to calculate fugitive dust associated with the site preparation and grading phases, for example, from activities such as: haul road grading, earth bulldozing, and truck loading. For fugitive dust calculations during grading and site preparation, the maximum number of acres graded in a day is determined by the number of grading equipment, which is assumed to operate for up to eight hours. PM<sub>10</sub> and PM<sub>2.5</sub> emissions from fugitive dust will be controlled by watering the construction site twice daily to represent compliance with SCAQMD Rule 403. CalEEMod® defaults assume watering the construction site two times a day reduces the fugitive dust emissions by 55%.

The emissions associated with off-road construction equipment during various phases of construction are shown in the CalEEMod® output files in **Appendix A**.

### **3.2.2 Emissions from On-Road Trips**

Construction generates on-road vehicle exhaust (including evaporative emissions) and entrained road dust emissions from personal vehicles for worker/vendor commuting and trucks for soil/material hauling. These emissions are based on the number of trips and vehicle miles traveled (VMT) along with EMFAC2017 emission factors. The numbers of worker

---

<sup>11</sup> SCAQMD. 2021. California Emissions Estimator Model User's Guide, Appendix A, pages 6-8. Version 2020.4.0. Available at: <http://www.CalEEMod.com/>. Accessed: December 2022.

and vendor trips were based on project-specific data. The number of haul trips was estimated based on the volume of soil to be exported, the amount of building square footage demolished, and the CalEEMod® default assumption for haul truck capacity.

CalEEMod® methodology was also used to calculate on-road fugitive dust associated with paved and unpaved roads using the default emission factors from United States Environmental Protection Agency (USEPA) AP-42. The vehicle miles traveled from worker commuting, vendor commutes, soil hauling, and demolition hauling are accounted for in this analysis.

The emissions associated with on-road activities during various phases of construction can be seen in the CalEEMod® output files in **Appendix A**.

### **3.2.3 Emissions from Architectural Coating**

VOC or VOC off-gassing emissions result from evaporation of solvents contained in surface coatings, such as paints. CalEEMod® calculates the VOC evaporative emissions from application of residential and non-residential surface coatings.

Emissions for coating categories were calculated based on default VOC content data from CalEEMod®, which was provided by the air districts, including SCAQMD where the proposed Project would be located. The CalEEMod® default VOC content for SCAQMD is based on SCAQMD Rule 1113.

The emissions associated with architectural coating are included as a part of on-site construction emissions as shown in the CalEEMod® output file in **Appendix A**.

### **3.2.4 Maximum Daily Emissions from Construction**

Since construction phases may or may not overlap in time, the maximum daily construction emissions will not necessarily be the sum of all possible daily emissions. CalEEMod®, therefore, calculates the maximum daily emissions for each construction phase. The program will then add together the maximum daily emissions for each construction phase that overlaps in time. Finally, the program will report the highest of these combined overlapping phases as a daily maximum. The maximum daily CAP emissions estimated due to construction of the proposed Project are summarized in **Table ES-1**. The estimated emissions show that the regional daily emissions for construction are less than the SCAQMD mass daily significance thresholds for all pollutants. Hence, the air quality impacts of maximum daily CAP emissions from Project construction would be less than significant.

The construction emission estimates are assumed to conservatively represent the maximum emissions for the proposed Project. The proposed Project will comply with SCAQMD Rules and Regulations that require the use of low VOC containing coatings to minimize the potential VOC emissions.

## **3.3 Maximum Daily Emissions from Project Operation**

Operational emissions are emissions that would occur after build-out of the proposed Project. This analysis identifies operational emissions for source categories including area sources, energy use, and mobile sources. The CAP operational mass emissions of VOC, NOx, CO, SOx, PM<sub>10</sub>, and PM<sub>2.5</sub> from area sources, mobile sources, and energy use were estimated using CalEEMod®. The CalEEMod® output can be found in **Appendix A**.

### **3.3.1 Area Sources**

Area sources are emission sources that are generally too small to be uniquely identified as point sources, and are thus generally aggregated as a group. CalEEMod® estimates emissions for the following sources, which are included under the category of “area” sources: landscaping equipment (e.g., lawn mowers), hearths, consumer products, and architectural coatings. CAP emissions due to natural gas combustion in buildings could also be considered as an area source, but are reported by CalEEMod® in the emissions associated with building energy use (described below). The CAP emissions generated by the proposed Project were calculated using CalEEMod® defaults.

#### **3.3.1.1 Landscaping Equipment**

Landscape maintenance includes fuel combustion emissions from equipment such as lawnmowers, rototillers, shredders/grinders, blowers, trimmers, chain saws, and hedge trimmers, as well as air compressors, generators, and pumps. The mass emissions of VOC, NOx, CO, SOx, PM<sub>10</sub>, and PM<sub>2.5</sub> associated with landscaping equipment were calculated using the CalEEMod® default emission factors (i.e., grams per square foot per day for non-residential buildings and grams per dwelling unit per day for residential buildings), which were processed using OFFROAD2011 and ARB’s Technical Memo: Change in Population and Activity Factors for Lawn and Garden Equipment.<sup>12</sup> Based on CalEEMod® defaults, all operational days (i.e., 250 days per year) were assumed to be summer days, with no snow days. Therefore, the emission factors were multiplied by the total building square footage and the number of summer days. Pieces of equipment that would typically be used in snow conditions, such as snow blowers, were assumed to have no operational days.

#### **3.3.1.2 Consumer Products**

Consumer products are chemically formulated products used by institutional consumers, including, but not limited to, detergents; cleaning compounds; polishes; floor finishes; lawn and garden products; disinfectants; sanitizers; aerosol paints; and automotive specialty products; but does not include other paint products, furniture coatings, or architectural coatings. SCAQMD did an evaluation of consumer product use compared to the total square footage of buildings using data from ARB consumer product Emission Inventory. VOC emissions from consumer product use were estimated based on the Project building area along with the default VOC emission rate in CalEEMod®<sup>13</sup> for Architectural Coatings.

VOC off-gassing emissions result from evaporation of solvents contained in surface coatings such as in paints and primers. The operational emission methodology for architectural coating is the same as the construction emission methodology. All land use buildings are assumed to be repainted at a rate of 10% of area per year, based on CalEEMod® default assumptions.

#### **3.3.1.3 Estimated Emissions from Area Sources**

Operational emissions associated with area sources of the proposed Project are shown in CalEEMod® output file in **Appendix A** and summarized in **Table ES-2**. The primary source of

<sup>12</sup> ARB. 2003. Change in Population and Activity Factors for Lawn and Garden Equipment. Available at: [https://ww3.arb.ca.gov/msei/2001\\_residential\\_lawn\\_and\\_garden\\_changes\\_in\\_eqpt\\_pop\\_and\\_act.pdf](https://ww3.arb.ca.gov/msei/2001_residential_lawn_and_garden_changes_in_eqpt_pop_and_act.pdf). Accessed: December 2022.

<sup>13</sup> SCAQMD. 2021. California Emissions Estimator Model User’s Guide. Appendix A. Page 31. Version 2020.4.0. Available at: <http://www.caleemod.com>. Accessed: December 2022.

VOC emissions from area sources are consumer products, and the primary source of NO<sub>x</sub> and CO emissions from area sources are landscaping equipment.

### **3.3.2 Building Energy Use**

Criteria pollutants are emitted as a result of activities in buildings for which natural gas is typically used as an energy source. Combustion of any type of fuel emits criteria pollutants directly into the atmosphere; when this occurs in a building, this is a direct emission source associated with that building. CalEEMod® default emission factors for building energy reflect the 2019 Title 24 Part 6 building code. This is a conservative estimation of the Project energy use as the Project will meet the 2022 Title 24 Part 6 building code. Climate zone 8 was selected based on the Project location and CalEEMod® forecast climate zone map. The Project has no planned natural gas usage. Accordingly, the operational emissions are zero associated with building energy use of the proposed Project as shown in the CalEEMod® output file in **Appendix A** and summarized in **Table ES-2**.

### **3.3.3 Mobile Source Emissions**

The CAP emissions associated with on-road mobile sources are generated from residents, workers, customers, and delivery vehicles visiting the land use types in the project. The emissions associated with on-road mobile sources includes running and starting exhaust emissions, evaporative emissions, brake and tire wear, and fugitive dust from paved and unpaved roads. Starting and evaporative emissions are associated with the number of starts or time between vehicle uses and the assumptions used in determining these values are described below. Idling exhaust emissions are based on the amount of time a vehicle spends idling. All of the other emissions are dependent on VMT. Ramboll used the Project-specific trip rates provided by the Fehr & Peers Transportation Consultants as inputs for the CalEEMod® model run.

#### **3.3.3.1 Vehicle Trip Type**

In CalEEMod®, the trip type breakdown describes the purpose of the trip generated at each land use. For example, the trip type breakdown indicates the percentage of trips generated at single family home for work, for shopping, and for other purposes. Two sets of trip type breakdown are used in CalEEMod®.<sup>14</sup>

- **Residential Trips** – These trips include home-work (H-W), home-shop (H-S), or home-other (H-O). An H-W trip represents the trip from the home to the workplace. An H-S trip represents the trip from the home to a land use where shopping takes place (generally retail). An H-O represents all other types of trips generated from the resident such as school, entertainment, etc. The trip type breakdown in CalEEMod® is from district-supplied information or the 1999 Caltrans Statewide Travel Survey is used as default or specific information obtained from the various Districts.
- **Commercial Trips** – These trips include commercial-customer (C-C), commercial-work (C-W) and commercial-nonwork (C-NW). A C-C trip represents a trip made by someone who is visiting the commercial land use to partake in the services offered by the site. The C-W trip represents a trip made by someone who is employed by the commercial land use. The C-NW trip represents a trip associated with the commercial land use other than

---

<sup>14</sup> SCAQMD. 2021. California Emissions Estimator Model User's Guide, Appendix A, page 20. Version 2020.4.0. Available at: <http://www.CalEEMod.com/>. Accessed: December 2022.

by customers or workers. An example of C-NW trips includes trips made by delivery vehicles of goods associated with the land use. The trip type breakdown from the number of workers and/or truck trips from Institute of Transportation Engineers and an analysis of information provided for the South Coast Air Basin (SCAB) was used as default to assign the trip type breakdowns for all land uses in CalEEMod®.

### **3.3.3.2 Trip Rates**

Trip rates are one of the parameters used to calculate Project mobile source emissions. CalEEMod® relies upon trip generation rates by land use types and associated average trip length by trip type to estimate the criteria air pollutant emissions. Project-specific trip rates provided by the Fehr & Peers Transportation Consultants were used as input for the CalEEMod® model run. These are presented in **Table 8**.

### **3.3.3.3 Trip Length**

Trip lengths are another factor used to calculate Project mobile source emissions. Total VMT by mobile sources is estimated as a product of trip rates and the average trip length. The default CalEEMod® trip lengths for Los Angeles County located within SCAQMD jurisdiction were used.

### **3.3.3.4 Vehicle Fleet Mix**

Vehicle fleet mix is another parameter used to estimate mobile source emissions from Project operation. Each vehicle type has a different emission factor for each pollutant, so CalEEMod® relies upon vehicle fleet mixes by land use type to estimate the criteria air pollutant emissions for each land use. The CalEEMod® default fleet mix for the portion of Los Angeles County located within SCAQMD jurisdiction was used in this analysis.

### **3.3.3.5 Estimated Emissions from Mobile Sources**

Operational emissions associated with operational mobile sources of the proposed Project are shown in CalEEMod® output file in **Appendix A** and summarized in **Table ES-2**.

## **3.3.4 Operational Emissions Results**

The regional daily emissions estimated due to Project operations are summarized in **Table ES-2**. These emissions were estimated using the methodology as described above. The estimated emissions include on-site emissions from stationary sources and off-site emissions from on-road sources. The primary source of the operational emissions is the traffic mobile sources.

For criteria air pollutants, the emissions for existing uses are subtracted from the full buildout mass emissions, to get the Project emissions, which are then compared to the SCAQMD mass daily significance thresholds. As shown in **Table ES-2**, the maximum daily emissions for the proposed Project's operational activities are less than the SCAQMD mass daily significance thresholds for all CAPs, i.e. VOC, NO<sub>x</sub>, CO, SO<sub>2</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>. Hence, air quality impacts of the maximum daily CAP emissions from Project operation would be less than significant.

## 4. COMPLIANCE WITH AMBIENT AIR STANDARDS

### 4.1 Localized Significance Thresholds

As discussed in Section 2, the LSTs are used to evaluate the construction and operational emissions relative to the SCAQMD ambient air quality standard significance thresholds. The on-site construction and operational emissions for NO<sub>x</sub>, CO, PM<sub>10</sub>, and PM<sub>2.5</sub> are compared to their respective thresholds provided in Appendix C of SCAQMD's LST Methodology.<sup>15</sup> The Source Receptor Area (SRA) applicable to the Project is SRA Number 3, Southwest Coastal Los Angeles County, based on Project location. As a conservative approach, the thresholds chosen are for a Project site area of five acres since there is no published threshold specifically for the Project site area of 5.25 acres. The receptor distance was chosen based on the lowest, and thus conservative, threshold for each pollutant for the "5-acre" LST. While the exact construction schedule and equipment mix may vary from the current analysis, the maximum daily emissions are not expected to be higher than that estimated given the conservative assumptions included in this analysis.

As shown in **Table ES-3**, the maximum daily on-site emissions for Project construction and operation are less than the SCAQMD mass-rate Localized Significance Thresholds<sup>16</sup> for NO<sub>x</sub>, CO, PM<sub>10</sub>, and PM<sub>2.5</sub>. Since the screening analysis shows that the construction and operational emissions are below the mass-rate LSTs, the Project's contribution to the localized air concentrations of these pollutants would be less than significant and further air dispersion modeling is not required.

The construction emissions are based on conservative assumptions to represent the maximum level of construction activity that may occur on the Project site on a given day. Furthermore, the construction LST analysis is based on the combination of maximum emissions that may occur with the worst-case meteorological conditions. Thus, these are conservatively high estimates and may never occur.

### 4.2 Localized Carbon Monoxide Impacts

Based on the analysis presented below, a CO "hot spots" analysis is not needed to determine whether the change in the level of service (LOS) of an intersection in the Project would have the potential to result in exceedances of the California Ambient Air Quality Standards or National Ambient Air Quality Standards.

It has long been recognized that CO exceedances are caused by vehicular emissions,<sup>17</sup> primarily when idling at intersections.<sup>18, 19</sup> Accordingly, vehicle emissions standards have become increasingly more stringent. Before the first vehicle emission regulations, cars in the

<sup>15</sup> SCAQMD. 2008. Final Localized Significance Threshold Methodology. Appendix C. July. Available at: <http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/final-lst-methodology-document.pdf>. Accessed: December 2022.

<sup>16</sup> SCAQMD, 2008. Final Localized Significance Threshold Methodology. Appendix C. July. Available at: <http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/appendix-c-mass-rate-lst-look-up-tables.pdf?sfvrsn=2>. Accessed: December 2022.

<sup>17</sup> USEPA. 2000. Air Quality Criteria for Carbon Monoxide. EPA 600/P-099/001F. June.

<sup>18</sup> SCAQMD. 1993. CEQA Air Quality Handbook. Section 4.5. April.

<sup>19</sup> SCAQMD. 2003. Air Quality Management Plan. August.

1950s were typically emitting about 87 grams of CO per mile.<sup>20</sup> Since the first regulation of CO emissions from vehicles (model year 1966) in California, vehicle emissions standards for CO applicable to light-duty vehicles have decreased by 96% for automobiles<sup>21, 22</sup> and new cold weather CO standards have been implemented, effective for the 1996 model year.<sup>23</sup> Currently, the CO standard in California is a maximum of 3.4 grams/mile for passenger cars (with provisions for certain cars to emit even less).<sup>24</sup> With the turnover of older vehicles, introduction of cleaner fuels and implementation of control technology on industrial facilities, CO concentrations in the SCAQMD have steadily declined.

The analysis prepared for CO attainment in the South Coast Air Basin by the SCAQMD can be used to assist in evaluating the potential for CO exceedances in the South Coast Air Basin. CO attainment was thoroughly analyzed as part of the SCAQMD's 2003 Air Quality Management Plan (2003 AQMP) and the 1992 Federal Attainment Plan for Carbon Monoxide (1992 CO Plan).<sup>25</sup> As discussed in the 1992 CO Plan, peak carbon monoxide concentrations in the South Coast Air Basin are due to unusual meteorological and topographical conditions, and not due to the impact of particular intersections. Considering the region's unique meteorological conditions and the increasingly stringent CO emissions standards, CO modeling was performed as part of 1992 CO Plan and subsequent plan updates and air quality management plans.

In the 1992 CO Plan, a CO hot spot analysis was conducted for four busy intersections in Los Angeles at the peak morning and afternoon time periods. The intersections evaluated included: Long Beach Boulevard and Imperial Highway (Lynwood) Wilshire Boulevard and Veteran Avenue (Westwood); Sunset Boulevard and Highland Avenue (Hollywood); and La Cienega Boulevard and Century Boulevard (Inglewood). These analyses did not predict a violation of CO standards. The busiest intersection evaluated was that at Wilshire Boulevard and Veteran Avenue, which has a daily traffic volume of approximately 100,000 vehicles per day. The 2003 AQMP estimated that the 1-hour concentration for this intersection was 4.6 ppm.<sup>26</sup> The most recent three years (2018 through 2020) of background 1-hour CO concentrations in the project vicinity range from 1.6 to 1.8 ppm.<sup>27</sup> This indicates that the most stringent 1-hour CO standard (20.0 ppm) would likely not be exceeded until the daily traffic at the intersection exceeded more than 400,000 vehicles per day.<sup>28</sup> The Los Angeles

<sup>25</sup> SCAQMD. 1992. Federal Attainment Plan for Carbon Monoxide.

<sup>26</sup> It is conservatively assumed that 4.6 ppm does not account for background CO concentration.

<sup>27</sup> SCAQMD Historical Data by Year for Source/Receptor Area 3. Available at: <https://www.aqmd.gov/home/air-quality/historical-air-quality-data/historical-data-by-year>. Accessed: December 2022.

<sup>28</sup> Based on the ratio of the CO standard (20.0 ppm) and the modeled value (4.6 ppm).

County Metropolitan Transportation Authority evaluated the LOS in the vicinity of the Wilshire Boulevard/Veteran Avenue intersection<sup>29</sup> and found it to be Level E at peak morning traffic and Level F at peak afternoon traffic.<sup>30</sup>

Given that the new trips generated by the Project (~1,713 one-way net trips per weekday, see **Table 8** for trip rate assumptions for Proposed Project and existing uses) is approximately 0.4% of the daily traffic volumes that would be expected to generate CO exceedances as evaluated in the 2003 AQMP, the average daily traffic volumes at the intersections impacted by the project for the 2027 plus Project scenario is not expected to result in an exceedance the 1-hour CO standard.

#### **4.3 Odors**

The occurrence and severity of potential odor impacts depends on numerous factors. The nature, frequency, and intensity of the source, the wind speeds and direction, and the sensitivity of the receiving location each contribute to the intensity of the impact. While offensive odors rarely cause any physical harm, they can be unpleasant and cause distress among the public and generate citizen complaints. According to the SCAQMD, land uses associated with odor complaints typically include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding. The Project does not include any uses identified by the SCAQMD as being associated with odors, and thus the Project does not anticipate any odor impacts.

#### **4.4 Consistency Evaluation with SB 375 (SCAG RTP/SCS)**

The Southern California Association of Governments (SCAG) RTP is a long-range transportation plan that is developed and updated by SCAG every four years. The RTP provides a vision for transportation investments throughout the region and the SCS will integrate land use and transportation strategies.<sup>31</sup>

The 2020-2045 RTP/SCS projects an increase of 1.6 million households in the region and 800,000 households in Los Angeles County from 2016 to 2045. For Gardena, the 2020-2045 RTP/SCS projects an increase of 2,900 households between 2016 and 2045.<sup>32</sup> The Project has 403 households, which is approximately 0.03% of the projected household growth for the region and approximately 0.05% of the projected household growth for Los Angeles County. In addition, the Project was compared against the RTP/SCS forecasts and network changes included in the 2020 SCAG RTP model. Given that the Project would not result in any changes to the existing transportation network, and would be increasing housing density in urban infill areas near transit, it is consistent with the RTP/SCS. Accordingly, the Project's generation of employees would be consistent with the employment projections contained in

<sup>29</sup> The Metropolitan Transportation Authority measured traffic volumes and calculated the LOS for the intersection Wilshire Blvd/ Sepulveda Avenue, which is a block west along Wilshire Boulevard, still east of Highway 405.

<sup>30</sup> Metropolitan Transportation Authority. 2004. Congestion Management Program for Los Angeles County. Exhibit 2-6 and Appendix A. July 22.

Accessed: December 2022.

<sup>32</sup> 2020. Current Context: Demographics and Growth Forecast. Available at: [https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocal\\_demographics-and-growth-forecast.pdf?1606001579](https://scag.ca.gov/sites/main/files/file-attachments/0903fconnectsocal_demographics-and-growth-forecast.pdf?1606001579). Accessed: December 2022.

the 2016-2040 RTP/SCS. Because the 2016-2040 RTP/SCS projections form the basis of the 2016 AQMP, the Project would be consistent with the projections in the AQMP. Therefore, the Project is consistent with SCAG's 2020 RTP/SCS and the SCAQMD 2016 AQMP.

#### **4.5 Consistency Evaluation with SCAQMD's 2016 Air Quality Management Plan**

In accordance with SCAQMD's *CEQA Air Quality Handbook*, Chapter 12, a project is consistent with SCAQMD's 2016 Air Quality Management Plan (AQMP), if it would result in no air quality violations and if it is consistent with the population, housing, and employment assumptions that were used in the development of the AQMP. In the case of the 2016 AQMP, two sources of data form the basis for the projections of air pollutant emissions: the City's General Plan and SCAG's 2016–2040 RTP/SCS. As noted above, the 2020–2045 RTP/SCS has recently been adopted and is anticipated to form the basis of the next AQMP.

As analyzed above, the project would not result in an air quality violation. The project is also consistent with the population and housing assumptions that were assumed in the 2016–2040 RTP/SCS. The 2016–2040 RTP/SCS projects an increase of 3.4 million residents in the region and 1.4 million residents in Los Angeles County from 2015 to 2040. For Gardena, the 2016–2040 RTP/SCS projects an increase of 3,600 households and 9,300 residents between 2012 and 2040.<sup>33</sup> The Project proposes 403 households, and therefore is well within the growth assumptions of the 2016–2040 RTP/SCS.

Because the project would not result in an air quality violation and is consistent with the growth assumptions underlying the 2016–2040 RTP/SCS, it is consistent with the 2016 AQMP.

#### **4.6 Construction Health Risk Assessment**

A health risk assessment has been performed by Air Quality Dynamics to assess the risk to nearby receptors due to construction of the project. Please see the Air Quality Dynamics 16911 South Normandie Gardena Development - Construction Health Risk Assessment Report for further details.

## 5. SUMMARY OF RESULTS

**Table ES-1** presents the maximum daily CAP emissions associated with Project construction. The proposed Project will comply with SCAQMD Rule 403 to minimize fugitive dust, which is incorporated into this analysis. As shown in **Table ES-1**, emissions of all CAPs are less than SCAQMD's mass daily significance thresholds. Hence, the air quality impacts of maximum daily CAP emissions from Project construction would be less than significant.

**Table ES-2** presents the maximum daily criteria air pollutant emissions associated with Project operation. The primary source of the operational CAP emissions (except VOC) is traffic-related mobile sources. As shown in **Table ES-2**, net emissions of all CAPs for the proposed Project as compared to the existing conditions are less than SCAQMD's mass daily significance thresholds. Hence, air quality impacts of the maximum daily CAP emissions from Project operation would be less than significant.

The localized air quality impacts of Project construction and operational activities were evaluated using SCAQMD's LST methodology. As shown in **Table ES-3**, Project-related on-site construction and operational emissions would not result in an exceedance of LSTs for nitrogen dioxide ( $\text{NO}_2$ ), CO,  $\text{PM}_{10}$ , and  $\text{PM}_{2.5}$  standards. Therefore, the Project's contribution to the localized air concentrations of these pollutants would be less than significant.

**TABLES**

Table ES-1. Maximum Daily Criteria Air Pollutant Emission Estimates for Project Construction  
 Normandie Crossing Specific Plan Project  
 Gardena, California

Year	Maximum Daily Criteria Air Pollutant Emissions <sup>1,2,3</sup> (lb/day)					
	VOC <sup>4</sup>	NO <sub>x</sub>	CO	SO <sub>x</sub>	PM <sub>10</sub> <sup>5</sup>	PM <sub>2,5</sub> <sup>5</sup>
Construction

2026	10.8	3.9	28.2	0.1	3.6	1.0
2027	10.8	2.6	27.7	0.1	3.5	1.0
Maximum Daily <sup>6</sup>	11	6	28	0	9	5
SCAQMD Significance Threshold <sup>7</sup>	75	100	550	150	150	55
Above Threshold	NO	NO	NO	NO	NO	NO

Notes:

<sup>1</sup> Emissions shown here are based on Project-specific construction schedule, hauling material, and on-road vehicle trips. CalEEMod® defaults were used for on-site construction equipment mix. Emissions were estimated using CalEEMod®. Refer to Appendix A for detailed CalEEMod® outputs.

<sup>2</sup> Project construction assumes the use of USEPA Tier 4 for construction equipment greater than 50 hp.

<sup>3</sup> Numbers are rounded for reporting purposes.

<sup>4</sup> For purposes of this analysis the VOC emissions are assumed to be equal to ROG.

<sup>5</sup> PM emissions are estimated as a sum of exhaust, tire wear, brake wear, and fugitive dust emissions. PM fugitive dust emissions during construction include a 55% reduction (for watering at least two times daily to comply with SCAQMD Rule 403).

<sup>6</sup> The maximum emissions reported for each pollutant may occur on different days. The sum of the emissions may not add up due to rounding.

## 1.0 Project Characteristics

---

### 1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Refrigerated Warehouse-Rail	6.64	1000sqft	0.15	6,640.00	0
Unrefrigerated Warehouse-Rail	78.93	1000sqft	1.81	78,930.00	0
Unrefrigerated Warehouse-No Rail	20.53	1000sqft	0.47	20,530.00	0

### 1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	33
Climate Zone	8			Operational Year	2021
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	434.98	CH4 Intensity (lb/MWhr)	0.033	N2O Intensity (lb/MWhr)	0.004

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics - SCE RPS in 2021

Land Use -

Construction Phase - Operational emissions only for the project.

Off-road Equipment - Project-specific data.

Grading - Project- specific data.

Trips and VMT - Project-specific data.

Architectural Coating - Project-specific data.

Vehicle Trips - Trip rates from project-specific data.

Off-road Equipment - Project-specific data.

## Normandie Crossing Specific Plan Project - Los Angeles-South Coast County, Annual

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied**

**Normandie Crossing Specific Plan Project**  
**Los Angeles-South Coast County, Annual**

## 1.0 Project Characteristics

---

### 1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Apartments Mid Rise	328.00	Dwelling Unit	2.32	241,581.00	938
Condo/Townhouse	75.00	Dwelling Unit	2.93	115,982.00	215
Enclosed Parking with Elevator	559.00	Space	1.59	138,625.00	0
Recreational Swimming Pool	1.60	1000sqft	0.04	1,600.00	0

### 1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	33
Climate Zone	8			Operational Year	2027
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	339.11	CH4 Intensity (lb/MWhr)	0.033	N2O Intensity (lb/MWhr)	0.004

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics - SCE RPS in 2027

Land Use - Project-specific land use

Construction Phase - construction schedule based on project-specific information

Grading - soil export quantities based on project-specific data

Demolition -

Trips and VMT - construction trips based on project-specific information

Vehicle Trips - Project-specific trip rates

Woodstoves - no wood-burning fireplaces or woodstoves

## Normandie Crossing Specific Plan Project - Los Angeles-South Coast County, Annual

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied**

Energy Use - No natural gas use for apartments, townhomes, or swimming pools; electricity use that accounts for the natural gas replacement in the residential dwelling units is included

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied**

**Normandie Crossing Specific Plan Project**  
**Los Angeles-South Coast County, Summer**

**1.0 Project Characteristics****1.1 Land Usage**

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Apartments Mid Rise	328.00	Dwelling Unit	2.32	241,581.00	938
Condo/Townhouse	75.00	Dwelling Unit	2.93	115,982.00	215
Enclosed Parking with Elevator	559.00	Space	1.59	138,625.00	0
Recreational Swimming Pool	1.60	1000sqft	0.04	1,600.00	0

**1.2 Other Project Characteristics**

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	33
Climate Zone	8			Operational Year	2027
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	339.11	CH4 Intensity (lb/MWhr)	0.033	N2O Intensity (lb/MWhr)	0.004

**1.3 User Entered Comments & Non-Default Data**

Project Characteristics - SCE RPS in 2027

Land Use - Project-specific land use

Construction Phase - construction schedule based on project-specific information

Grading - soil export quantities based on project-specific data

Demolition -

Trips and VMT - construction trips based on project-specific information

Vehicle Trips - Project-specific trip rates

Woodstoves - no wood-burning fireplaces or woodstoves

## Normandie Crossing Specific Plan Project - Los Angeles-South Coast County, Summer

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied**

Energy Use - No natural gas use for apartments, townhomes, or swimming pools; electricity use that accounts for the natural gas replacement in the residential dwelling units is included

## Normandie Crossing Specific Plan Project - Los Angeles-South Coast County, Winter

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied**

**Normandie Crossing Specific Plan Project**  
**Los Angeles-South Coast County, Winter**

**1.0 Project Characteristics****1.1 Land Usage**

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Apartments Mid Rise	328.00	Dwelling Unit	2.32	241,581.00	938
Condo/Townhouse	75.00	Dwelling Unit	2.93	115,982.00	215
Enclosed Parking with Elevator	559.00	Space	1.59	138,625.00	0
Recreational Swimming Pool	1.60	1000sqft	0.04	1,600.00	0

**1.2 Other Project Characteristics**

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	33
Climate Zone	8			Operational Year	2027
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	339.11	CH4 Intensity (lb/MWhr)	0.033	N2O Intensity (lb/MWhr)	0.004

**1.3 User Entered Comments & Non-Default Data**

Project Characteristics - SCE RPS in 2027

Land Use - Project-specific land use

Construction Phase - construction schedule based on project-specific information

Grading - soil export quantities based on project-specific data

Demolition -

Trips and VMT - construction trips based on project-specific information

Vehicle Trips - Project-specific trip rates

Woodstoves - no wood-burning fireplaces or woodstoves

## Normandie Crossing Specific Plan Project - Los Angeles-South Coast County, Winter

**EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied**

Energy Use - No natural gas use for apartments, townhomes, or swimming pools; electricity use that accounts for the natural gas replacement in the residential dwelling units is included
