

The background image shows a modern residential complex from an aerial perspective. It features several multi-story buildings with light-colored facades and dark-framed windows. A prominent feature is a large, rectangular swimming pool located between the buildings, surrounded by a deck with lounge chairs and small trees. The complex is situated in an urban environment with other buildings visible in the distance.

Appendix 4.1-2: Health Risk Assessment

TECHNICAL MEMORANDUM

To: Greg Tsujiuchi and Lisa Kranitz, City of Gardena
From: Olivia Chan
Date: July 12, 2023
Subject: **Normandie Crossing Specific Plan Project - Construction Health Risk Assessment Peer Review**

Kimley-Horn has conducted a follow-up third-party peer review of the Project's Construction Health Risk Assessment (Air Quality Dynamics, July 2023) on behalf of the City of Gardena to verify that Kimley-Horn's March 7, 2023 third-party peer review Technical Memo (TM) recommendations have been incorporated. The revised July 2023 report addressed the third-party peer review comments and thus is in compliance with the TM recommendations. The analysis, as revised, meets the applicable provisions of CEQA and the State CEQA Guidelines and is adequate for inclusion in the Project EIR.

Please do not hesitate to contact Olivia Chan at olivia.chan@kimley-horn.com with any questions.

Attn: Fred Shaffer

Re: Normandie Crossing Specific Plan Project - Construction Health Risk Assessment

Mr. Shaffer:

Per your request, Air Quality Dynamics has prepared a health risk assessment (HRA) to quantify the impact of diesel particulate matter (DPM), which is identified as a toxic air contaminant pursuant to California Code of Regulations Section 93001, associated with the generation of off-road equipment emissions during construction of the proposed project. This was done to supplement the air quality analysis prepared by Ramboll which evaluated criteria pollutant exposures associated with project construction and operation.

The HRA quantifies both carcinogenic risks and noncarcinogenic hazards for the maximum exposed residential receptor adjoining the project site. To ensure a viable quantification of exposure, the technical approach used in the preparation of the HRA was composed of all relevant and appropriate assessment and dispersion modeling methodologies presented by the U.S. Environmental Protection Agency, California Environmental Protection Agency and South Coast Air Quality Management District (SCAQMD).

Results of the HRA showed carcinogenic risk and noncarcinogenic hazard estimates for the maximum exposed residential receptor did not exceed identified significance thresholds. The following discussion outlines the methodology utilized to conduct the HRA and summarizes the protocol used to evaluate DPM exposures.

Source Identification

The project proposes the development of a 7-story podium design residential apartment building comprised of 328 dwelling units totaling 241,109 square feet with 75 adjoining 3-story townhome units totaling 115,982 square feet resulting in a total of 403 dwelling units. Courtyards, pool and dog park amenities are additionally proposed.

The site is currently improved with 106,100 square feet of building space and adjoining parking accommodations. The project proposes removal of all existing improvements and related site preparation, grading and earthmoving activities to facilitate development of the site.

The project is located at 16829-16911 South Normandie Avenue on a 5.25 acre (228,559 square feet) parcel adjoining urban uses including multi-family residential buildings, commercial structures and single family dwellings.

It is anticipated that the project will begin and complete construction within a 38-month calendar period. Figure 1 presents an aerial photograph of the project location and adjoining community.

Site Location /Vicinity Aerial Photograph

Source Characterization

On-site construction emission estimates were based upon the Los Angeles-South Coast County profile generated by the California Emissions Estimator Model (CalEEMod Version 2020.4.0) prepared by Ramboll. CalEEMod is an emissions model which provides a uniform platform quantifying pollutant emissions associated with project construction and operation. The model is considered a comprehensive tool for quantifying air quality impacts from projects located throughout the State prepared under the auspices of the California Environmental Quality Act (CEQA).

In 1998, diesel exhaust emissions in the PM₁₀ particle size range were identified by the State of California as a toxic air contaminant. As such, the off-road PM₁₀ exhaust estimates reported by CalEEMod, which assumed diesel-powered construction equipment will meet EPA-certified Tier 4 Final emission standards, were used to assess DPM exposures. The emission rates for both winter and summer scenarios were found to be commensurate.

To assess localized impacts, construction phase, calendar year and number of days associated with on-site construction activity were identified to produce an average daily emission rate. Construction operations are reported to occur for 994 days over a 1160-day period (3.18 years) based upon a 6 day per week (313 days per year) operational schedule which accounts for concurrent phase activities during paving and architectural coating operations.

Table 1 provides a summary of estimated average daily particulate emissions associated with each identified construction phase and year. Attachment B presents the emission calculation worksheet used to quantify pollutant source strength. Excerpts from the CalEEMod output file which identify construction phase timelines and associated emission rates are provided in Attachment C.

Table 1
Average Daily Emissions/PM₁₀

| Construction Phase/Year | Emissions (Lbs/Day) |
|---|---------------------|
| Demolition/2024 | 0.0616 |
| Site Preparation/2024 | 0.0621 |
| Site Grading/Excavation/2024 | 0.0484 |
| Townhome/Apartment Foundations/Garages/2024 | 0.0853 |
| Townhome/Apartment Foundations/Garages/2025 | 0.0788 |
| Townhome/Apartment Framing/Rough-in/2025 | 0.0788 |
| Townhome/Apartment Framing/Rough-in/2026 | 0.0788 |
| Paving/Architectural Coating/2026 | 0.0414 |
| Paving/Architectural Coating/2027 | 0.0414 |
| Average Emissions | 0.0671 |

Exposure Quantification

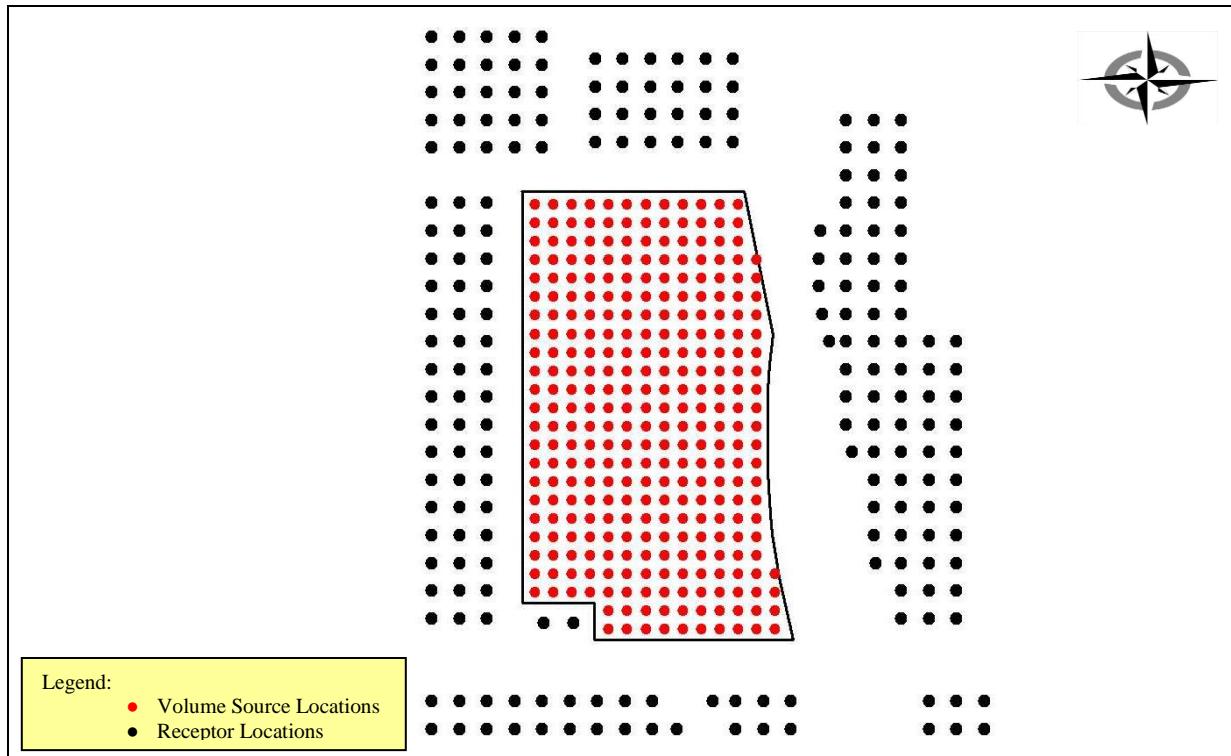

In order to assess the impact of DPM emissions, air quality modeling utilizing the American Meteorological Society (AMS)/EPA Regulatory Model (AERMOD) was performed. AERMOD is a steady-state Gaussian plume model applicable to directly emitted air pollutants that employs best state-of-practice parameterizations for characterizing meteorological influences and atmospheric dispersion. AERMOD is the U.S. Environmental Protection Agency's guideline model for the assessment of near-field pollutant dispersion.

The SCAQMD provides guidance (*Localized Significance Threshold Methodology*, July 2008) on the evaluation of localized air quality impacts to public agencies conducting environmental review of projects located within its jurisdiction. As such, source treatment outlined in the Localized Significance Threshold (LST) methodology was utilized whereby exhaust emissions from construction equipment were treated as a set of side-by-side elevated volume sources with a release height of five and an initial vertical (σ_z) dimension of 1.4 meters. The elevated source characterization accounts for a mid-range plume rise height associated with exhaust stack

emissions for typical off-road equipment inventories. Horizontal (σ_y) parameters were produced by dividing source separation distances by a standard deviation of 2.15.

To accommodate a Cartesian grid format, direction dependent calculations were obtained by identifying the universal transverse mercator (UTM) coordinates for each volume source location. UTM coordinates were also identified for residential receptors adjoining the project site. A flagpole receptor height of two meters was assumed and assigned to each receptor location. A graphical representation of the source-receptor grid network is presented in Figure 2.

Figure 2
Source-Receptor Grid Network

Refined air dispersion models require meteorological information to account for local atmospheric conditions. Due to their sensitivity to individual meteorological parameters such as wind speed and direction, the U.S. Environmental Protection Agency recommends that meteorological data used as input into dispersion models be selected on the basis of relative spatial and temporal conditions that exist in the area of concern. In response to this recommendation, meteorological data from the SCAQMD Hawthorne Airport (Source Receptor Area 3) monitoring station which is located approximately 3.62 miles northwest of the project site was used to represent local weather conditions and prevailing winds.

In a manner consistent with SCAQMD guidance for the assessment of chronic exposures, maximum concentrations were produced by incorporating all five years of available meteorological data. A model scalar value of 1 was assigned to account for emissions generated during construction related activity corresponding to 8 hours per day as reported in the

CalEEMod construction profile from 8 a.m. to 4 p.m. (ending hours 9 to 16). A scalar value of 0 was used for non-operational hours. A copy of the AERMOD dispersion model output file is provided in Attachment D.

Risk Characterization

Carcinogenic compounds are not considered to have threshold levels (i.e., dose levels below which there are no risks). Any exposure, therefore, will have some associated risk. As a result, the SCAQMD has established a maximum incremental cancer risk which meets or exceeds a threshold of 10 in one million (10E-06) for projects prepared under CEQA. This threshold is also consistent with the State of California as a level posing no significant risk for exposures to carcinogens regulated under the Safe Drinking Water and Toxic Enforcement Act (Proposition 65).

Health risks associated with exposure to carcinogenic compounds can be defined in terms of the probability of developing cancer as a result of exposure to a chemical at a given concentration. Under a deterministic approach (i.e., point estimate methodology), the cancer risk probability is determined by multiplying the chemical's annual concentration by its unit risk factor (URF). The URF is a measure of the carcinogenic potential of a chemical when a dose is received through the inhalation pathway. It represents an upper-bound estimate of the probability of contracting cancer as a result of continuous exposure to an ambient concentration of one microgram per cubic meter ($\mu\text{g}/\text{m}^3$) over a 70 year lifetime. The URF and corresponding cancer potency factor for DPM utilized in the assessment was obtained from the *Consolidated Table of OEHHA/ARB Approved Risk Assessment Health Values*.

A review of available guidance was conducted to determine applicability of the use of early life exposure adjustments to identified carcinogens. For risk assessments conducted under the auspices of The Air Toxics "Hot Spots" Information and Assessment Act (AB 2588, Connelly, Statutes of 1987; Health and Safety Code Section 44300 et seq.) a weighting factor is applied to all carcinogens regardless of purported mechanism of action. Notwithstanding, applicability of AB 2588 is limited to commercial and industrial operations. There are two broad classes of facilities subject to the AB 2588 Program: Core facilities and facilities identified within discrete industry-wide source categories. Core facilities subject to AB 2588 compliance are sources whose criteria pollutant emissions (particulate matter, oxides of sulfur, oxides of nitrogen and volatile organic compounds) are 25 tons per year or more as well as those facilities whose criteria pollutant emissions are 10 tons per year or more but less than 25 tons per year. Industry-wide source facilities are classified as smaller operations with relatively similar emission profiles (e.g., auto body shops, gas stations and dry cleaners using perchloroethylene). The off-road source emissions generated from the construction of the proposed project are not classified as core operations nor subject to industry-wide source evaluation.

Additionally, in comments presented to the SCAQMD Governing Board (Meeting Date: June 5, 2015, Agenda No. 28) relating to toxic air contaminant exposures under Rules 1401, 1401.1, 1402 and 212 revisions, use of the revised OEHHA guidelines and their applicability for projects

subject to CEQA as they relate to the incorporation of early-life exposure adjustments, it was reported that:

The Proposed Amended Rules are separate from the CEQA significance thresholds. SCAQMD staff is currently evaluating how to implement the Revised OEHHA Guidelines under CEQA. The SCAQMD staff will evaluate a variety of options on how to evaluate health risks under the Revised OEHHA Guidelines under CEQA. The SCAQMD staff will conduct public workshops to gather input before bringing recommendations to the Governing Board.

To date, the SCAQMD, as a commenting agency, has not conducted public workshops nor developed policy relating to the applicability of applying the revised OEHHA guidance for projects prepared by other public/lead agencies subject to CEQA.

As such, the HRA relied upon U.S. Environmental Protection Agency guidance relating to the use of early life exposure adjustment factors (*Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens*, EPA/630/R-003F) whereby adjustment factors are only considered when carcinogens act “through the mutagenic mode of action.” In 2006, the U.S. Environmental Protection Agency published a memorandum which provides guidance regarding the preparation of health risk assessments should carcinogenic compounds elicit a mutagenic mode of action (USEPA, 2006). As presented in the technical memorandum, numerous compounds were identified as having a mutagenic mode of action. For diesel particulates, polycyclic aromatic hydrocarbons (PAHs) and their derivatives, which are known to exhibit a mutagenic mode of action, comprise < 1% of the exhaust particulate mass. To date, the U.S. Environmental Protection Agency reports that whole diesel engine exhaust has not been shown to elicit a mutagenic mode of action (USEPA, 2018).

In addition, the California Department of Toxic Substances Control (DTSC) which is charged with protecting individuals and the environment from the effects of toxic substances and responsible for assessing, investigating and evaluating sensitive receptor populations to ensure that properties are free of contamination or that health protective remediation levels are achieved has adopted the U.S. Environmental Protection Agency’s policy in the application of early life exposure adjustments and is consistent with the methodology considered in the assessment of residential exposures. As such, incorporation of early life exposure adjustments for exposures to DPM emissions in the quantification of carcinogenic risk for construction of the proposed project were not considered in the HRA.

To quantify dose, the procedure requires the incorporation of several discrete exposure variates. To account for upper-bound exposures associated with residential occupancies, lifetime risk values were adjusted to account for an exposure frequency of 313 days per year for a period of 3.18 years (i.e., 0.25 years for the third trimester, 2.0 years for ages 0 to 2 years and 0.93 years for the 2 to 9 year age group). Point estimates for daily breathing rates representing the 95th percentile of 361, 1090 and 861 L/kg-day for the identified age groups were utilized and incorporated into the following dose algorithm.

$$Dose_{air} = C_{air} \times \{BR/BW\} \times A \times EF \times 10^{-6}$$

Where:

| | |
|--------------|---|
| $Dose_{air}$ | = dose through inhalation (mg/kg/day) |
| C_{air} | = concentration of contaminant in air ($\mu\text{g}/\text{m}^3$) |
| $\{BR/BW\}$ | = daily breathing rate normalized to body weight (L/kg body weight/day) |
| A | = inhalation absorption factor (unitless) |
| EF | = exposure frequency (days/365 days) |
| 10^{-6} | = micrograms to milligrams conversion |

The above inhalation dose estimates and residential fractional time adjustments (i.e., 0.85 for the third trimester and ages 0 to 2 years and 0.72 for ages 2 to 16 years) were incorporated into the following equation to produce carcinogenic risk estimates for ages commensurate with the reported exposure durations.

$$Risk_{inh} = Dose_{air} \times CPF \times ED/AT \times FAH$$

Where:

| | |
|--------------|--|
| $Risk_{inh}$ | = inhalation cancer risk |
| $Dose_{air}$ | = daily inhalation dose (mg/kg/day) |
| CPF | = inhalation cancer potency factor ($\text{mg}/\text{kg}/\text{day}^{-1}$) |
| ED | = exposure duration for specified age group (years) |
| AT | = averaging time (years) |
| FAH | = fraction of time at home (unitless) |

Table 2 presents the carcinogenic risk estimate for the maximum exposed residential receptor. Attachment A, Tables A1 through A3, column b identify the predicted DPM concentration, columns f-h, present the URF, corresponding cancer potency factor and dose for each exposure scenario. The cancer risk estimate is presented in column i.

Table 2
Carcinogenic Risk / Maximum Exposed Residential Receptor

| Age Group | Risk |
|-----------------|----------------|
| Third Trimester | 2.8E-08 |
| 0 to 2 years | 4.9E-07 |
| 2 to 9 years | 1.5E-07 |
| Total | 6.6E-07 |

Note: 6.6E-07 denotes an excess case of cancer of 6.6 in ten million (10,000,000) individuals exposed. The individual risk values by age group are rounded values. The total risk value represents the actual summation of risk for the identified occupancy.

As noted above, the carcinogenic risk for the maximum exposed residential receptor did not meet or exceed the significance threshold of 10 in one million (10E-06).

An evaluation of the potential noncancer effects of DPM exposure was also conducted. Under the point estimate approach, adverse health effects are evaluated by comparing the pollutant concentration with the appropriate Reference Exposure Level (REL). The chronic REL presented

in the *Consolidated Table of OEHHA/ARB Approved Risk Assessment Health Values* was considered in the assessment. There are no available acute/8-hour reference exposure levels for DPM.

To quantify noncarcinogenic impacts, the hazard index approach was used. The hazard index assumes that subthreshold exposures adversely affect a specific organ or organ system (i.e., toxicological endpoint). To calculate the hazard index, the pollutant concentration or dose is divided by its toxicity value. Should the total equal or exceed one (i.e., unity), a health hazard is presumed to exist. No exposure frequency or duration adjustments are considered for noncarcinogenic exposures.

For chronic noncarcinogenic effects, the hazard index for the respiratory endpoint totaled less than one for the maximum exposed residential receptor.

Table 3 presents the hazard index value for the maximum exposed residential receptor. Attachment A, Tables A1 through A3, column j presents the REL used in the evaluation of chronic noncarcinogenic exposure. The noncancer hazard index generated from off-road equipment activity is presented in column l.

Table 3
Noncarcinogenic Hazards / Maximum Exposed Residential Receptor

| Receptor | Hazard |
|-------------|---------|
| Residential | 4.1E-03 |

Note: 4.1E-03 is commensurate with a numeric value of 0.0041.

Conclusion

Based upon the predicted carcinogenic risk and noncarcinogenic hazard estimates for the residential exposure scenario, the HRA demonstrates that construction of the proposed project will not result in unacceptable localized impacts.

I can be reached at (818) 703-3294 should you have any questions or require additional information.

Sincerely,

Bill Piazza

ME W186 1155 MEOPEN: THRESH_1MIN 1-min ASOS wind speed threshold used 0.50
ME W187 1155 MEOPEN: ADJ_U* Option for Stable Low Winds used in AERMET

*** SETUP Finishes Successfully ***

*** AERMOD - VERSION 22112 *** *** Normandie Crossing Specific Plan Project *** 07/05/23
*** AERMET - VERSION 16216 *** *** Diesel Particulate (DPM) / Construction *** 19:32:45
*** MODELOPTs: RegDEFAULT CONC ELEV FLGPOL NODRYDPLT NOWETDPLT URBAN ADJ_U* PAGE 1

*** MODEL SETUP OPTIONS SUMMARY ***

** Model Options Selected:
* Model Uses Regulatory DEFAULT Options
* Model Is Setup For Calculation of Average CONCenration Values.
* NO GAS DEPOSITION Data Provided.
* NO PARTICLE DEPOSITION Data Provided.
* Model Uses NO DRY DEPLETION. DDPLTE = F
* Model Uses NO WET DEPLETION. WETDPLT = F
* Stack-tip Downwash.
* Model Accounts for ELEVated Terrain Effects.
* Use Calms Processing Routine.
* Use Missing Data Processing Routine.
* No Exponential Decay.
* Model Uses URBAN Dispersion Algorithm for the SBL for 305 Source(s),
for Total of 1 Urban Area(s):
Urban Population = 9818605.0 ; Urban Roughness Length = 1.000 m
* Urban Roughness Length of 1.0 Meter Used.
* ADJ_U* - Use ADJ_U* option for SBL in AERMET
* CCVR_Sub - Meteorological data includes CCVR substitutions
* TEMP_Sub - Meteorological data includes TEMP substitutions
* Model Accepts FLAGPOLE Receptor . Heights.
* The User Specified a Pollutant Type of: OTHER

**Model Calculates ANNUAL Averages Only

**This Run Includes: 305 Source(s); 1 Source Group(s); and 207 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 305 VOLUME source(s)
and: 0 AREA type source(s)
and: 0 LINE source(s)
and: 0 RLINE/RLINEXT source(s)
and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with a total of 0 line(s)
and: 0 SWPOINT source(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 16216

**Output Options Selected:
 Model Outputs Tables of ANNUAL Averages by Receptor
 Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
 Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
 m for Missing Hours
 b for Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 19.00 ; Decay Coef. = 0.000 ; Rot. Angle = 0.0
 Emission Units = GRAMS/SEC ; Emission Rate Unit Factor = 0.10000E+07
 Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.7 MB of RAM.

**Input Runstream File: E:\WD Passport\normandie_gardena\model\SETUP4_2012-2016_OTHER.DTA
 **Output Print File: E:\WD Passport\normandie_gardena\model\SETUP4_2012-2016_OTHER.LST

**File for Summary of Results: E:\WD Passport\normandie_gardena\model\SETUP4_2012-2016_OTHER.SUM
