1.0 EXECUTIVE SUMMARY

The proposed Madison Flats project is a residential development consisting of senior residential apartments with 76 dwelling units and a low-rise apartment development consisting of 45 multi-family dwelling units. All dwelling units for this project are categorized as affordable housing. The project is located south of the intersection of Winstrom Street and Railroad Avenue in the City of Riverside (City). The project parcel is considered as Medium Density Residential (MDR) and Commercial (C) in the City's General Plan Land Use and is zoned as Single Family Residential (R-1-7000). The project will require a General Plan Amendment (GPA) and Zone Change (ZC) for the project parcel. The General Plan Land Use will be changed from Medium Density Residential (MDR) and Commercial (C) to High Density Residential (HDR), while the Zoning will be changed from Single Family Residential (R-1-7000) to Multi-Family Residential (R-3-2000). The project is anticipated to be completed by year 2025.

The project can be accessed via three full access driveways:

- Project Driveway 1 located at Railroad Avenue west of Depot Street;
- Project Driveway 2 located at Railroad Avenue between Winstrom Street and Madison Street; and
- Project Driveway 3 located at Railroad Avenue between Winstrom Street and Madison Street.

The project is forecast to generate 52 trips in the a.m. peak hour, 59 trips in the p.m. peak hour, and 610 daily trips.

The study area for the project was finalized during the scoping agreement process and was based on the criteria defined in the City of Riverside Public Works Department *Traffic Impact Analysis (TIA) Guidelines for Vehicle Miles Traveled (VMT) and Level of Service (LOS) Assessment* (dated July 2020). As such, the study area includes 7 intersections and 4 roadway segments.

Traffic conditions were examined for the weekday daily, a.m., and p.m. peak hour conditions under the following scenarios:

- Existing Condition;
- Opening Year (2025) without Project Conditions;
- Opening Year (2025) with Project Conditions;
- Cumulative (2045) without Project Conditions; and
- Cumulative (2045) with Project Conditions.

1.1 EXISTING CONDITIONS SUMMARY

Based on the criteria as discussed in Section 3.2, Level of Service Procedures and Criteria, of this report, the following intersection is currently operating at a deficient LOS under existing conditions:

2. Madison Street/Indiana Avenue (p.m. peak hour only).

All other study intersections and roadway segments are currently operating at a satisfactory LOS. The City does not have a fair share program, therefore, the project would need to discuss with City staff the appropriate mechanism for implementation of this improvement.

1.2 OPENING YEAR (2025) CONDITIONS SUMMARY

Based on the criteria as discussed in Section 3.2, Level of Service Procedures and Criteria, of this report, under opening year without project conditions, the following intersection is forecast to operate at a deficient LOS:

2. Madison Street/Indiana Avenue (p.m. peak hour only).

All other study intersections and roadway segments are forecast to operate at a satisfactory LOS.

Under opening year with project conditions, the following intersection is forecast to operate at a deficient LOS:

2. Madison Street/Indiana Avenue (both a.m. and p.m. peak hours).

All other study intersections and roadway segments are forecast to operate at a satisfactory LOS.

With the implementation of improvements recommended in Chapter 11.1, the intersection of Madison Street/Indiana Avenue is forecast to operate at a satisfactory LOS in both a.m. and p.m. peak hours under opening year with project conditions.

Table 1-A summarizes the recommended improvements for study intersections and funding mechanism under opening year with project conditions. The City does not have a fair share program, therefore, the project would need to discuss with City staff the appropriate mechanism for implementation of this improvement.

1.3 CUMULATIVE (2045) CONDITIONS SUMMARY

Based on the criteria as discussed in Section 3.2, Level of Service Procedures and Criteria, of this report, under cumulative without project conditions, the following intersection is forecast to operate at a deficient LOS:

2. Madison Street/Indiana Avenue (both a.m. and p.m. peak hours).

All other study intersections and roadway segments are forecast to operate at a satisfactory LOS.

Under cumulative year with project conditions, the following intersection is forecast to operate at a deficient LOS:

2. Madison Street/Indiana Avenue (both a.m. and p.m. peak hours).

All other study intersections and roadway segments are forecast to operate at a satisfactory LOS.

With the implementation of improvements recommended in Chapter 11.1, the intersection of Madison Street/Indiana Avenue is forecast to operate at a satisfactory LOS in both a.m. and p.m. peak hours under cumulative with project conditions.

Table 1-A summarizes the recommended improvements for study intersections and funding mechanism under cumulative conditions. The City does not have a fair share program, therefore, the project would need to discuss with City staff the appropriate mechanism for implementation of this improvement.

1.4 ACTIVE TRANSPORTATION AND PUBLIC TRANSIT ANALYSIS SUMMARY

The project does not conflict with any existing or proposed bicycle, pedestrian, or public transit facilities. The project will construct a sidewalk along the project frontage on Railroad Avenue. Therefore, it can be considered to conform to all adopted policies, plans, or programs concerning these facilities and will not have a significant impact.

1.5 LIST OF CHAPTER 1.0 TABLES

- Table 1-A: Recommended Improvements for Intersections and Funding Mechanism

Table 1-A - Recommended Improvements for Intersections and Funding Mechanism

Intersection	Opening Year (2025) with Project Improvements	Cumulative (2045) with Project Improvements	Funding Mechanism	Improvements Covered by TUMF	Improvements Covered by Fair Share
2 . Madison Street/Indiana Avenue	Optimize signal timing (a.m. and p.m. peak hour)	Optimize signal timing (a.m. and p.m. peak hour)	Fair Share	-	Optimize signal timings.

Notes:

TUMF refers to the Transportation Uniform Mitigation Fee Program.

¹ The City does not have a fair share program, therefore, the project would need to discuss with City staff the appropriate mechanism for implementation of this improvement.

2.0 INTRODUCTION

The Traffic Operational Analysis (TOA) has been prepared for the proposed Madison Flats Project (project) to be located south of the intersection of Winstrom Street and Railroad Avenue in the City of Riverside (City). Figure 2-1 illustrates the regional and project location. (Figures and tables are located at the end of each chapter.)

This report is intended to satisfy the requirements established by the City of Riverside Public Works Department *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled and Level of Service Assessment* (dated July 2020). The scope of work for this TOA, including trip generation, trip distribution, study area, and analysis methodologies, has been approved by City staff via the Scoping Agreement process. A copy of the Scoping Agreement is included in Appendix A.

This study examines traffic operations in the vicinity of the proposed project under the following five scenarios:

- Existing Conditions;
- Opening Year (2025) without Project Conditions;
- Opening Year (2025) with Project Conditions;
- Cumulative (2045) without Project Conditions; and
- Cumulative (2045) with Project Conditions.

Traffic conditions were examined for the weekday daily, a.m., and p.m. peak hour conditions. The a.m. peak hour is defined as the one hour of highest traffic volumes occurring between 7:00 and 9:00 a.m. The p.m. peak hour is the one hour of highest traffic volumes occurring between 4:00 and 6:00 p.m. Roadway segments were analyzed using daily volume counts and comparisons were made to the daily service volume standards provided in the City's TIA Guidelines.

2.1 PROJECT DESCRIPTION

The proposed project is a residential development consisting of a senior residential apartments with 76 dwelling units and a low-rise apartment development consisting of 45 multi-family dwelling units. All dwelling units for this project are categorized as affordable housing. The project parcel is considered as Medium Density Residential (MDR) and Commercial (C) in the General Plan Land Use and zoned as Single Family Residential (R-1-7000). The project requires a General Plan Amendment (GPA) and Zone Change (ZC) for the project parcel. The General Plan Land Use will be changed from Medium Density Residential (MDR) and Commercial (C) to High Density Residential (HDR), while the Zoning will be changed from Single Family Residential (R-1-7000) to Multi-Family Residential (R-3-2000). The project is anticipated to be completed by year 2025. Figures 2-2, 2-3, and 2-4 illustrate the conceptual site plan for the proposed project.

As shown in Figure 2-2, the project can be accessed via three full access driveways:

- Project Driveway 1 located at Railroad Avenue west of Depot Street;

- Project Driveway 2 located at Railroad Avenue between Winstrom Street and Madison Street; and
- Project Driveway 3 located at Railroad Avenue between Winstrom Street and Madison Street.

Traffic Operations Analysis
Conceptual Site Plan Part 3 of 3

3.0 ANALYSIS METHODOLOGY AND CRITERIA

3.1 LEVEL OF SERVICE DEFINITIONS

LOS can be characterized for the whole intersection, by each intersection approach, and by each lane group. Control delay alone is used to characterize LOS for the entire intersection. Control delay quantifies the increase in travel time due to the traffic signal control and is a surrogate measure of driver discomfort and fuel consumption.

A complete description of the meaning of LOS can be found in the Transportation Research Board Special Report 209, *Highway Capacity Manual* (HCM). The HCM establishes LOS A through F for intersections. A description of LOS for signalized and unsignalized intersections is summarized in Table 3-A. A description of LOS for roadway segments is summarized in Table 3-B.

Table 3-C shows the LOS criteria for unsignalized and signalized intersections. Table 3-D summarizes the LOS criteria used to evaluate roadway segments based on the daily capacity for each functional classification pursuant to the City's TIA Guidelines. The daily traffic volumes represent the total vehicles (both directions) traveling on a roadway segment within 24 hours.

For all study area intersections, the *Highway Capacity Manual 6th Edition* (HCM 6) analysis methodologies were used to determine intersection LOS. Intersection LOS was calculated using the Synchro 11 software, which uses the HCM 6 methodologies.

3.2 LEVEL OF SERVICE PROCEDURES AND CRITERIA

Study intersections and roadway segments analyzed in this report are under the jurisdiction of the City of Riverside. The City uses LOS D as its minimum level of service criterion for intersections of Collector or higher classification streets. For all other intersections, the City uses LOS C as its minimum level of service criterion.

For projects in which the proposed uses or intensities are above those contained in the General Plan, operational improvements are required at study intersections within the City when the addition of project trips causes either the intersection peak hour LOS to degrade from acceptable (LOS A through D) to unacceptable levels (LOS E or F) or the peak hour delay to increase from "without project" to "with project" as follows:

- LOS A/B by 10.0 seconds;
- LOS C by 8.0 seconds;
- LOS D by 5.0 seconds;
- LOS E by 2.0 seconds; and
- LOS F by 1.0 second.

As stated in the City's TIA Guidelines, operational improvements at roadway segments are required when either the addition of project-related trips causes the roadway segment LOS to degrade from acceptable (LOS A through D) to unacceptable levels (LOS E or F) or when the roadway segment is

operating at an unacceptable LOS in the no project scenario and the addition of project trips causes the volume-to-capacity (V/C) ratio to increase by more than 5 percent.

3.3 LIST OF CHAPTER 3.0 TABLES

- Table 3-A: Intersection Level of Service Definitions
- Table 3-B: Roadway Segment Level of Service Definitions
- Table 3-C: Level of Service Criteria for Unsignalized and Signalized Intersections
- Table 3-D: Roadway Segment Capacity and Levels of Service

Table 3-A: Intersection Level of Service Definitions

LOS	Description
A	Traffic operations with a control delay of 10 seconds per vehicle or less and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is low and either progression is exceptionally favorable or the cycle length is very short. If LOS A is the result of favorable progression, most vehicles arrive during the green indication and travel through the intersection without stopping.
B	Traffic operations with control delay between 10 seconds per vehicle and 20 seconds per vehicle and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is low and either progression is highly favorable or the cycle length is short. More vehicles stop than with LOS A.
C	Traffic operations with control delay between 20 and 35 seconds per vehicle and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when progression is favorable or the cycle length is moderate. Individual cycle failures (i.e., one or more queued vehicles are not able to depart as a result of the insufficient capacity during the cycle) may begin to appear at this level. The number of vehicles stopping is significant, although many vehicles still pass through the intersection without stopping.
D	Traffic operations with control delay between 35 and 55 seconds per vehicle and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is high and either progression is ineffective or the cycle length is long. Many vehicles stop and individual cycle failures are noticeable.
E	Traffic operations with control delay between 55 and 80 seconds per vehicle and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when volume-to-capacity ratio is high, progression is unfavorable, and the cycle length is long. Individual cycle failures are frequent.
F	Traffic operations with control delay exceeding 80 seconds per vehicle or a volume-to-capacity ratio greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is very high, progression is very poor, and the cycle length is long. Most cycles fail to clear the queue.

Source: Highway Capacity Manual (6th Edition)**Table 3-B: Roadway Segment Level of Service Definitions**

LOS	Description
A	Describes primarily free-flow operation. Vehicles are completely unimpeded in their ability to maneuver within the traffic stream. Control Delay at the boundary intersection is minimal. The travel speed exceeds 80% of the base free-flow speed, and the volume-to-capacity ratio is no greater than 1.0.
B	Describes reasonably unimpeded operation. The ability to maneuver within the traffic stream is only slightly restricted, and control delay at the boundary is not significant. The travel speed is between 67% and 80% of the base free-flow speed, and the volume-to-capacity ratio is no greater than 1.0.
C	Describes stable operation. The ability to maneuver and change lanes at mid-segment locations may be more restricted than at LOS B. Longer queues at the boundary intersection may contribute to lower travel speeds. The travel speed is between 50% and 67% of the base free-flow speed, and the volume-to-capacity ratio is no greater than 1.0.
D	Indicates a less stable condition in which small increases in flow may cause substantial increases in delay and decreases in travel speed. This operation may be due to adverse signal progression, high volume, or inappropriate signal timing at the boundary intersections. The travel speed is between 40% and 50% of the base free-flow speed, and the volume-to-capacity ratio is no greater than 1.0.
E	Characterized by unstable operation and significant delay. Such operations may be due to some combination of adverse progression, high volume, and inappropriate signal timing at the boundary intersections. The travel speed is between 30% and 40% of the base free-flow speed, and the volume-to-capacity ratio is no greater than 1.0.
F	Characterized by flow at extremely low speed. Congestion is likely occurring at the boundary intersections, as indicated by high delay and extensive queuing. The travel speed is between 30% or less of the base free-flow speed, and the volume-to-capacity ratio is greater than 1.0.

Arterial (144')	50,600–57,799	57,800–64,999	65,000+

Source: City of Riverside Public Works Department *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled and Level of Service Assessment*, July 2020.

¹ Two-lane roadways designated as future arterials that conform to arterial design standards for vertical and horizontal alignments are analyzed as arterials.

4.0 EXISTING CONDITIONS

4.1 STUDY AREA

Based on the City's TIA Guidelines, the TOA is required to analyze all intersections of Collector or higher classification streets where the project would contribute 50 or more peak hour trips, along with intersections identified by City staff. Study intersections and roadway segments considered for the analysis were finalized during the TOA Scoping Agreement process.

4.1.1 Study Intersections

Intersections analyzed in this study and their jurisdictions are as follows:

1. Winstrom Street/Railroad Avenue (Riverside);
2. Madison Street/Indiana Avenue (Riverside);
3. Madison Street/Casa Blanca Street (Riverside);
4. Madison Street/Railroad Avenue (Riverside);
5. Project Driveway 1/Railroad Avenue (Riverside);
6. Project Driveway 2/Railroad Avenue (Riverside); and
7. Project Driveway 3/Railroad Avenue (Riverside).

Figure 4-1 illustrates the locations of all study intersections.

4.1.2 Roadway Segments

Roadway segments analyzed in this study are as follows:

1. Railroad Avenue, west of Winstrom Street (Riverside);
2. Railroad Avenue, between Winstrom Street and Madison Street (Riverside);
3. Madison Street, between Indiana Avenue and Railroad Avenue (Riverside); and
4. Madison Street, between Railroad Avenue and Evan Street (Riverside).

4.2 EXISTING ROADWAY NETWORK

This section provides a description of the circulation network within the study area. Figure 4-2 illustrates existing plus project study intersection geometrics and traffic control. Within the City of Riverside, all major roadways are classified based on the Master Plan of Roadways provided in the Circulation and Community Mobility Element of the City of Riverside *General Plan 2025* (General Plan). Figure 4-3 illustrates the Master Plan of Roadways for the City. Table 4-A summarizes the classifications and number of mid-block arterial lanes for the roadway segments analyzed in the TOA. Following is a brief description of major roadways within the study area:

- **Winstrom Street:** Within the study area, Winstrom Street serves as a local street but has no designation in the City's General Plan. Therefore, for the purposes of this analysis, Winstrom

Street has been considered as a local street. Between Indiana Avenue and Railroad Avenue, Winstrom Street is a two-lane, undivided road. There are no bike facilities along either direction for this segment. However, there is provision for on-street parking on both sides for this segment.

- **Madison Street:** Within the study area, Madison Street is designated as an 88-foot Arterial in the City's General Plan. Between Indiana Avenue and Railroad Avenue, Madison Street is a four-lane divided arterial with a two-way-left-turn-lane (TWLTL) median. Between Railroad Avenue and Evans Street, Madison Street is a two-lane raised median divided arterial. There are no bike facilities along either direction for both segments. There is also no provision for on-street parking on either side for both segments.
- **Indiana Avenue:** Within the study area, Indiana Avenue is designated as an 88-foot Arterial in the City's General Plan. West of Madison Street, Indiana Avenue is a four-lane undivided arterial. East of Madison Street, Indiana Avenue is a four-lane divided arterial with a TWLTL median. There are no bike facilities along either direction for both segments. There is provision for on-street parking on one side for both segments.
- **Casa Blanca Street:** Within the study area, Casa Blanca Street serves as a local street but has no designation in the City's General Plan. Therefore, for the purposes of this analysis, Casa Blanca Street has been considered as a local street. Between Jefferson Street and Madison Street, Casa Blanca Street is a two-lane, undivided road. There are no bike facilities along either direction for this segment. However, there is provision for on-street parking on both sides for this segment.
- **Railroad Avenue:** Within the study area, Railroad Avenue serves as a local street but has no designation in the City's General Plan. Therefore, for the purposes of this analysis, Railroad Avenue has been considered as a local street. Between Ricca Street and Madison Street, Railroad Avenue is a two-lane, undivided road. There are no bike facilities along either direction for this segment. However, there is provision for on-street parking on both sides for this segment.
- **Evans Street:** Within the study area, Evans Street serves as a local street but has no designation in the City's General Plan. Therefore, for the purposes of this analysis, Evans Street has been considered as a local street. Between Jefferson Street and Madison Street, Evans Street is a two-lane, undivided road. There are no bike facilities along either direction for this segment. However, there is provision for on-street parking on both sides for this segment.

4.3 EXISTING BICYCLE, PEDESTRIAN, AND TRANSIT FACILITIES

4.3.1 Bicycle Facilities

The City of Riverside promotes bicycling for recreation and mobility. Bicycling can be a viable alternative to local work commutes and offers children a healthy way to get to school. To facilitate and encourage bicycle trips, the City has adopted a Active Transportation Plan that includes a network of proposed facilities and a three-tier project prioritization for the recommended improvements. The *Pedestrian Target Safeguarding Plan, Active Transportation Plan, Complete Streets Ordinance, and Trails Master Plan (PACT)* (adopted December 2021) provides an updated

inventory of all bicycle infrastructure and non-infrastructure improvements implemented between 2012 and 2020 within the City of Riverside. The Active Transportation Plan also provides an updated list of recommended bicycle improvements, including a new network of proposed bicycle facilities.

According to the City's *PACT: Active Transportation Plan*, the bikeway network within the City is classified into four categories: Class I – Shared Use Paths, Class II – Bicycle Lanes, Class III – Bicycle Routes/Boulevard, and Class IV - Separated Bikeways. Class I shared use paths are paved trails completely separated from the street. Class II bicycle lanes are striped preferential lanes on the roadway for one-way bicycle travel, in which some of these lanes include a striped buffer on one or both sides to increase separation from the travel lane and/or parked cars. Class III bicycle routes are signed routes where cyclists share a travel lane with motor vehicle traffic, in which some routes include shared lane markings or "sharrows". Class IV separated bikeways are on-street bicycle facilities that are physically separated from motor vehicle traffic by a vertical element or barrier, such as a curb, bollards, or vehicle parking aisle. This allows for one- or two-way travel on one or both sides of the roadway.

As part of the City's Bikeway Network, a Class II Bike Lane exists near the project study area on Jefferson Street. A Class III Bicycle Boulevard has been proposed to be added along Madison Street within the study area. A Class II Bike Lane has been proposed near the project study area on Lincoln Avenue. Figure 4-4 illustrates the existing and proposed bikeways within the City of Riverside.

4.3.2 Pedestrian Facilities

The implementation of enhanced pedestrian linkage with a comprehensive trails system links residential areas, schools, parks, and commercial centers so that residents can travel within the community without driving. Safe and attractive sidewalks and walkways improve the walkability of the City. Citywide, sidewalks should generally be provided on both sides of the streets. Additionally, standard paved trails and non-standard unpaved trails are frequently used by bicyclists and pedestrians in the City. Some trails are also available for equestrian riders. The existence of trails and sidewalks provides accessible facilities, provides safety features, and improves walkability in the City of Riverside.

According to the City's PACT, the City's system of trails can be accessed through sidewalks provided on Railroad Avenue and Madison Street. The nearest proposed primary corridor is currently located at the intersection of Madison Street and Victoria Avenue. Furthermore, paved sidewalks are provided on Depot Street, Winstrom Street, Indiana Avenue, Casa Blanca Street, and Evans Street, allowing for convenient pedestrian access to nearby neighborhoods, parks, and local retail. Figure 4-5 illustrates the Master Plan of trails within the City.

4.3.3 Transit Facilities

Riverside Transit Agency (RTA) is the Consolidated Transportation Service Agency for western Riverside County and is responsible for coordinating transit services throughout the approximately 2,500-square-mile service area. RTA provides both local and regional services throughout the region with 33 fixed routes, five CommuterLink Express routes, and Dial-A-Ride services using 334 vehicles.

RTA local bus Route 14 operates within the study area. Route 14 has stops on Indiana Avenue providing connections to the Galleria at Tyler, Downtown Riverside, Hunter Park Metrolink Station, and Loma Linda VA Hospital.

4.4 EXISTING TRAFFIC VOLUMES

Existing traffic volumes were developed based on traffic counts collected by Counts Unlimited on December 2022. Daily vehicle counts were collected for roadway segments, while a.m. and p.m. peak hour turning movement counts were collected at study intersections. Detailed count sheets are included in Appendix B.

Vehicle classification counts were conducted at all study intersections. At these locations, counts were converted to Passenger Car Equivalent (PCE) volumes. The concept of PCEs accounts for the larger impact of trucks on traffic operations. It does so by assigning each type of truck a PCE factor that represents the number of passenger vehicles that could travel through an intersection in the same time that a particular type of truck could. PCE volumes at study intersections were developed using a factor of 1.5 for 2-axle trucks, 2.0 for 3-axle trucks, and 3.0 for trucks with four or more axles.

Figure 4-6 illustrates existing peak hour traffic volumes at study intersections. Table 4-B summarizes the existing daily traffic volumes at study area roadway segments.

Detailed volume development worksheets are included in Appendix C.

4.5 EXISTING LEVELS OF SERVICE

4.5.1 Study Intersections

An intersection LOS analysis was conducted for existing conditions using the methodologies previously discussed. For all signalized intersections, existing signal timing sheets were obtained from City staff and the corresponding signal timings were included in the Synchro files. Table 4-C summarizes the results of this analysis and shows that the following intersection is currently operating at a deficient LOS under existing conditions:

2. Madison Street/Indiana Avenue (p.m. peak hour only).

All other intersections are operating at a satisfactory LOS. Signal timing sheets are included in Appendix B. Detailed Level of Service Worksheets are included in Appendix D.

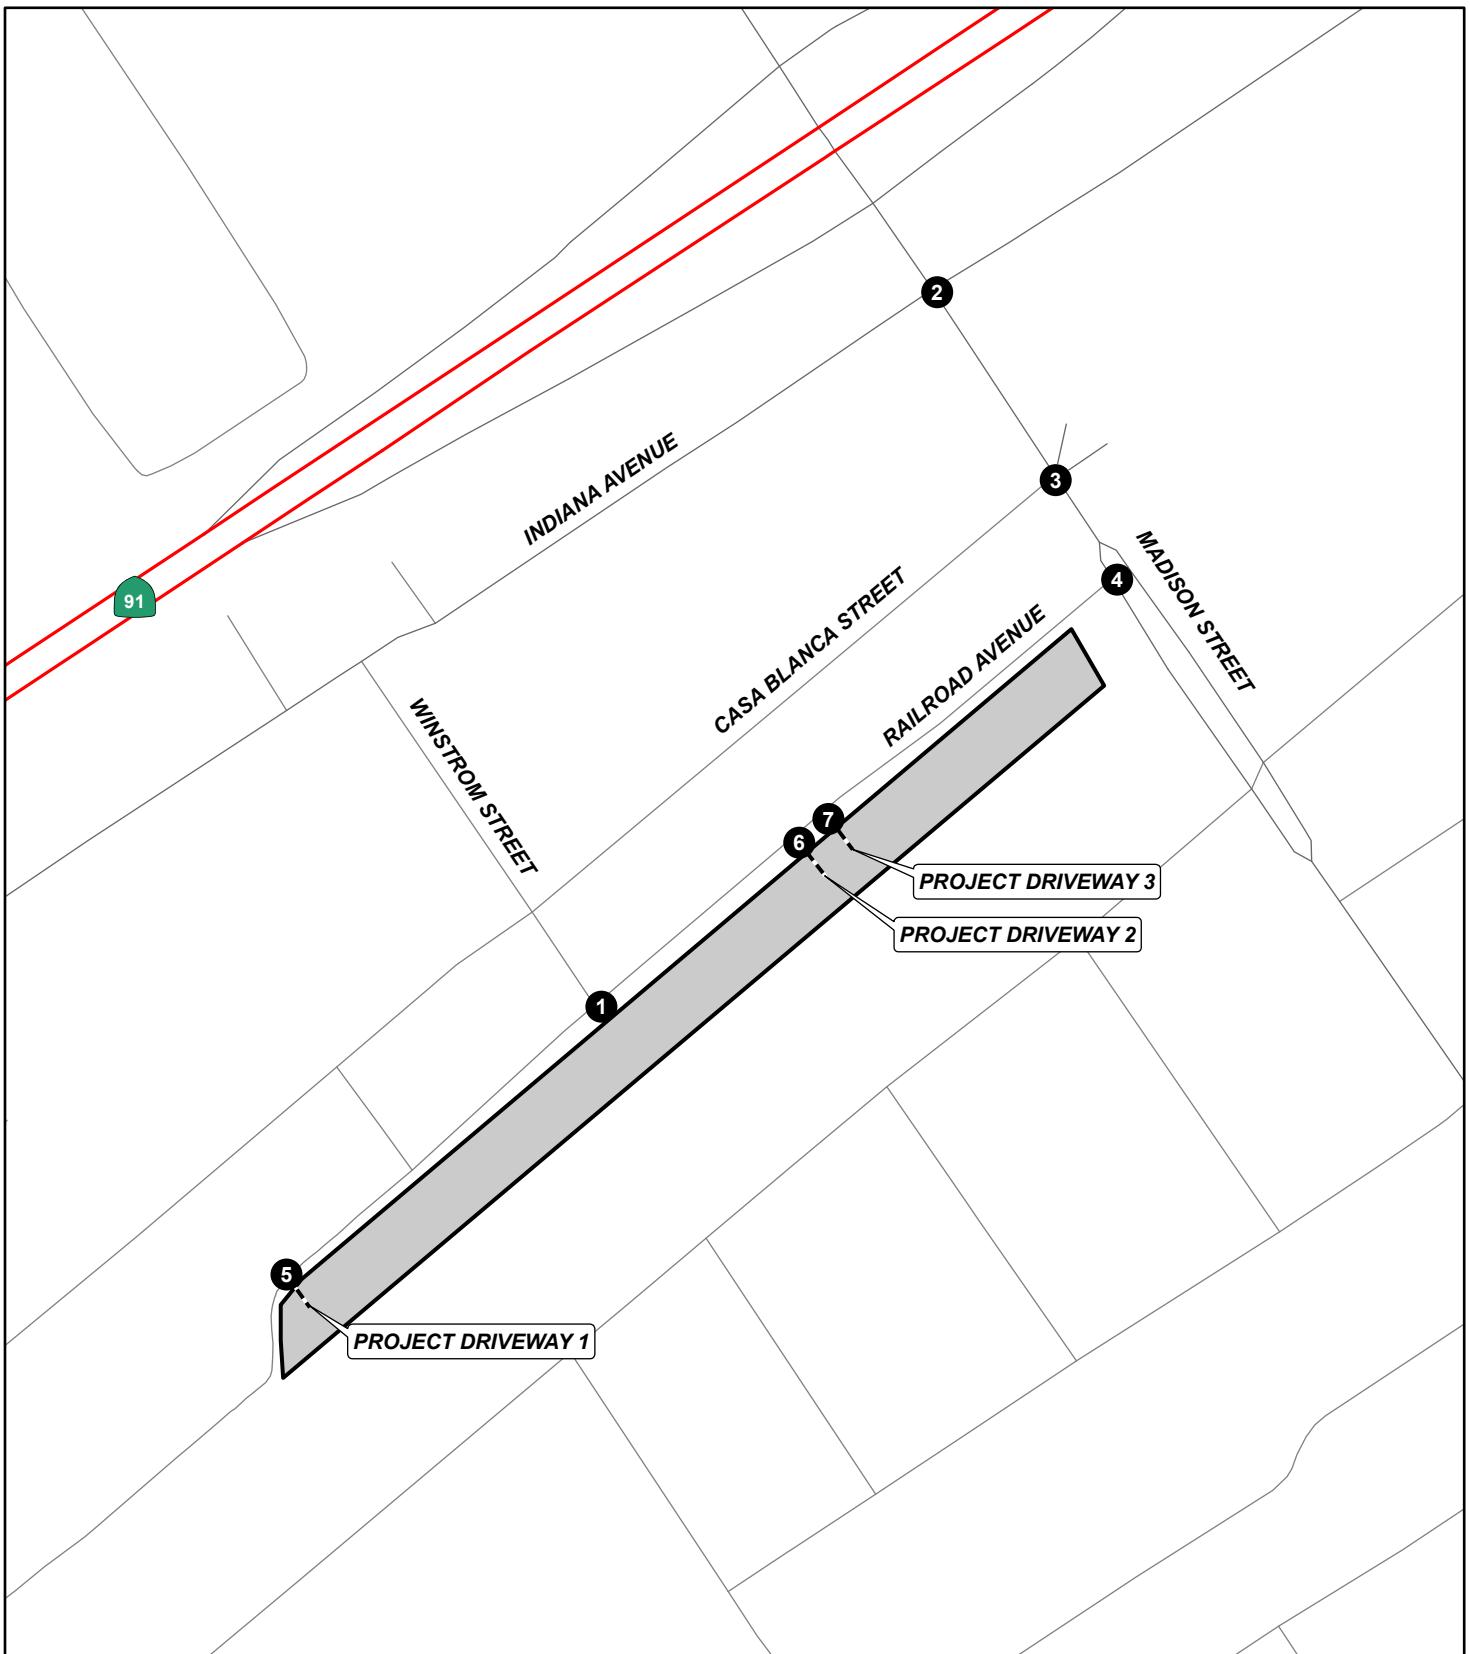

4.5.2 Roadway Segments

A roadway segment LOS analysis was conducted for existing conditions using the methodologies previously discussed. Table 4-D summarizes the results of this analysis and shows that all roadway segments currently operate at a satisfactory LOS.

4 . Between Railroad Avenue and Evan Street	City of Riverside	Arterial (88')	2	19,799	12,221	0.62	B

Notes:

LOS = Level of Service

* Exceeds LOS Standard

1 Roadway classification has been obtained from the City of Riverside General Plan Circulation and Community Mobility Element Master Plan of Roadways.

2 Roadway capacity has been obtained from the City of Riverside *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled and Level of Service Assessment* (dated July 2020).3 Operational deficiency determined based on the criteria included in the City of Riverside *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled and Level of Service Assessment* (dated July 2020).

5.0 PROJECT TRAFFIC

5.1 PROJECT TRIP GENERATION

The trip generation for the proposed project was developed using rates from the Institute of Transportation Engineers (ITE) *Trip Generation Manual* (11th Edition) for Land Use 252 – “Senior Adult Housing – Multifamily” and Land Use 220 – “Multifamily Housing (Low-Rise) Not Close to Rail Transit.” Table 5-A summarizes the project trip generation and shows the proposed project will generate 610 daily trips, with 52 trips occurring during the a.m. peak hour and 59 trips occurring during the p.m. peak hour.

5.2 PROJECT TRIP DISTRIBUTION AND ASSIGNMENT

The distribution of project trips was developed by examining the regional roadway network, and the location of employment and commercial centers, in relation to the proposed project. Project trip distribution at the driveways was developed by taking into consideration the location of the residential buildings and the adjacent project driveways. As such, the project trip distribution was approved through the City’s scoping agreement process. Figure 5-1 illustrates the project trip distribution. The project trip assignment is the product of the project trip generation and trip distribution percentages. Figure 5-2 illustrates the project trip assignment.

6.0 OPENING YEAR ANALYSIS

6.1 PROJECT DESIGN FEATURE

To improve safety for pedestrians, bicyclists, vehicular traffic, and all modes of transportation, the project will add stop controls at the following intersections as project design features:

5. Winstrom Street/Railroad Avenue (All-Way Stop Control);
6. Project Driveway 1 (One-Way Stop Control)/Railroad Avenue;
7. Project Driveway 2 (One-Way Stop Control)/Railroad Avenue; and
8. Project Driveway 3 (One-Way Stop Control)/Railroad Avenue.

In addition, the project will add stop bars and stop legends at project driveways and additional speed limit signs along the project frontage on Railroad Avenue.

The current width of Railroad Avenue is 36 feet. Assuming an 8 feet wide parking space along the north and south side of Railroad Avenue, a 20 feet wide travel lane would be available for eastbound and westbound traffic which is the same as existing conditions. As such, there will be no changes required to the parking provisions along Railroad Avenue in front of the project.

6.2 OPENING YEAR (2025) WITHOUT PROJECT TRAFFIC VOLUMES

As approved during the City's scoping agreement process (Appendix A), traffic volumes for opening year without project conditions were developed by applying a growth of 2.0 percent per annum to existing traffic volumes and adding trips from approved and pending development projects near the study area. This methodology was applied for both study intersections and roadway segments. Information concerning cumulative projects in the vicinity of the proposed project was obtained from City staff. Figure 6-1 illustrates the cumulative project locations. Trip generation for cumulative projects was developed using rates from the ITE *Trip Generation Manual* (11th Edition). Table 6-A lists the cumulative projects included in this analysis and shows the cumulative projects are estimated to generate 76 PCE trips in the a.m. peak hour, 88 PCE trips in the p.m. peak hour, and 944 daily PCE trips.

Cumulative projects trips were assigned to the roadway network based on their locations in relation to surrounding land uses and regional arterials. Figure 6-2 illustrates the total peak hour cumulative project trip assignment at study area intersections. Figure 6-3 illustrates the peak hour traffic volumes at study intersections under opening year without project conditions. Table 6-B summarizes opening year without project daily traffic volumes at study area roadways segment.

6.3 OPENING YEAR (2025) WITH PROJECT TRAFFIC VOLUMES

Opening year with project traffic volumes were developed by adding proposed project traffic to the opening year without project traffic volumes. Figure 6-4 illustrates the opening year with project peak hour traffic volumes at study intersections. Table 6-B summarizes opening year with project daily traffic at study area roadway segments.

Detailed volume development worksheets are included in Appendix C.

6.4 OPENING YEAR (2025) WITHOUT PROJECT LEVELS OF SERVICE

6.4.1 Study Intersections

Previously referenced Figure 4-2 illustrates the with project study intersection geometrics and traffic control. An intersections LOS analysis was conducted for opening year without project conditions using the methodologies previously discussed. Table 6-C summarizes the results of the analysis and shows that the following intersection is forecast to operate at an unsatisfactory LOS under opening year without project conditions,

2. Madison Street/Indiana Avenue (p.m. peak hour only).

All other intersections are forecast to operate at a satisfactory LOS.

6.4.2 Roadway Segments

A roadway segment LOS analysis was conducted for opening year without project conditions using the methodologies previously discussed. Table 6-D summarizes the results of this analysis and shows that all roadway segments are forecast to operate at a satisfactory LOS.

6.5 OPENING YEAR (2025) WITH PROJECT LEVELS OF SERVICE

6.5.1 Study Intersections

An intersection LOS analysis was conducted for opening year with project conditions using the methodologies previously discussed. Table 6-C summarizes the results of the analysis and shows that the following intersection is forecast to operate at an unsatisfactory LOS under opening year with project conditions,

2. Madison Street/Indiana Avenue (both a.m. and p.m. peak hour).

This intersection is forecast to operate at an unsatisfactory LOS even under opening year without project conditions for the p.m. peak hour. Therefore, the project would contribute to the forecast deficiency at this intersection. As such, improvements would be required at this intersection.

All other intersections are forecast to operate at a satisfactory LOS under opening year with project conditions. Detailed Level of Service Worksheets are included in Appendix D.

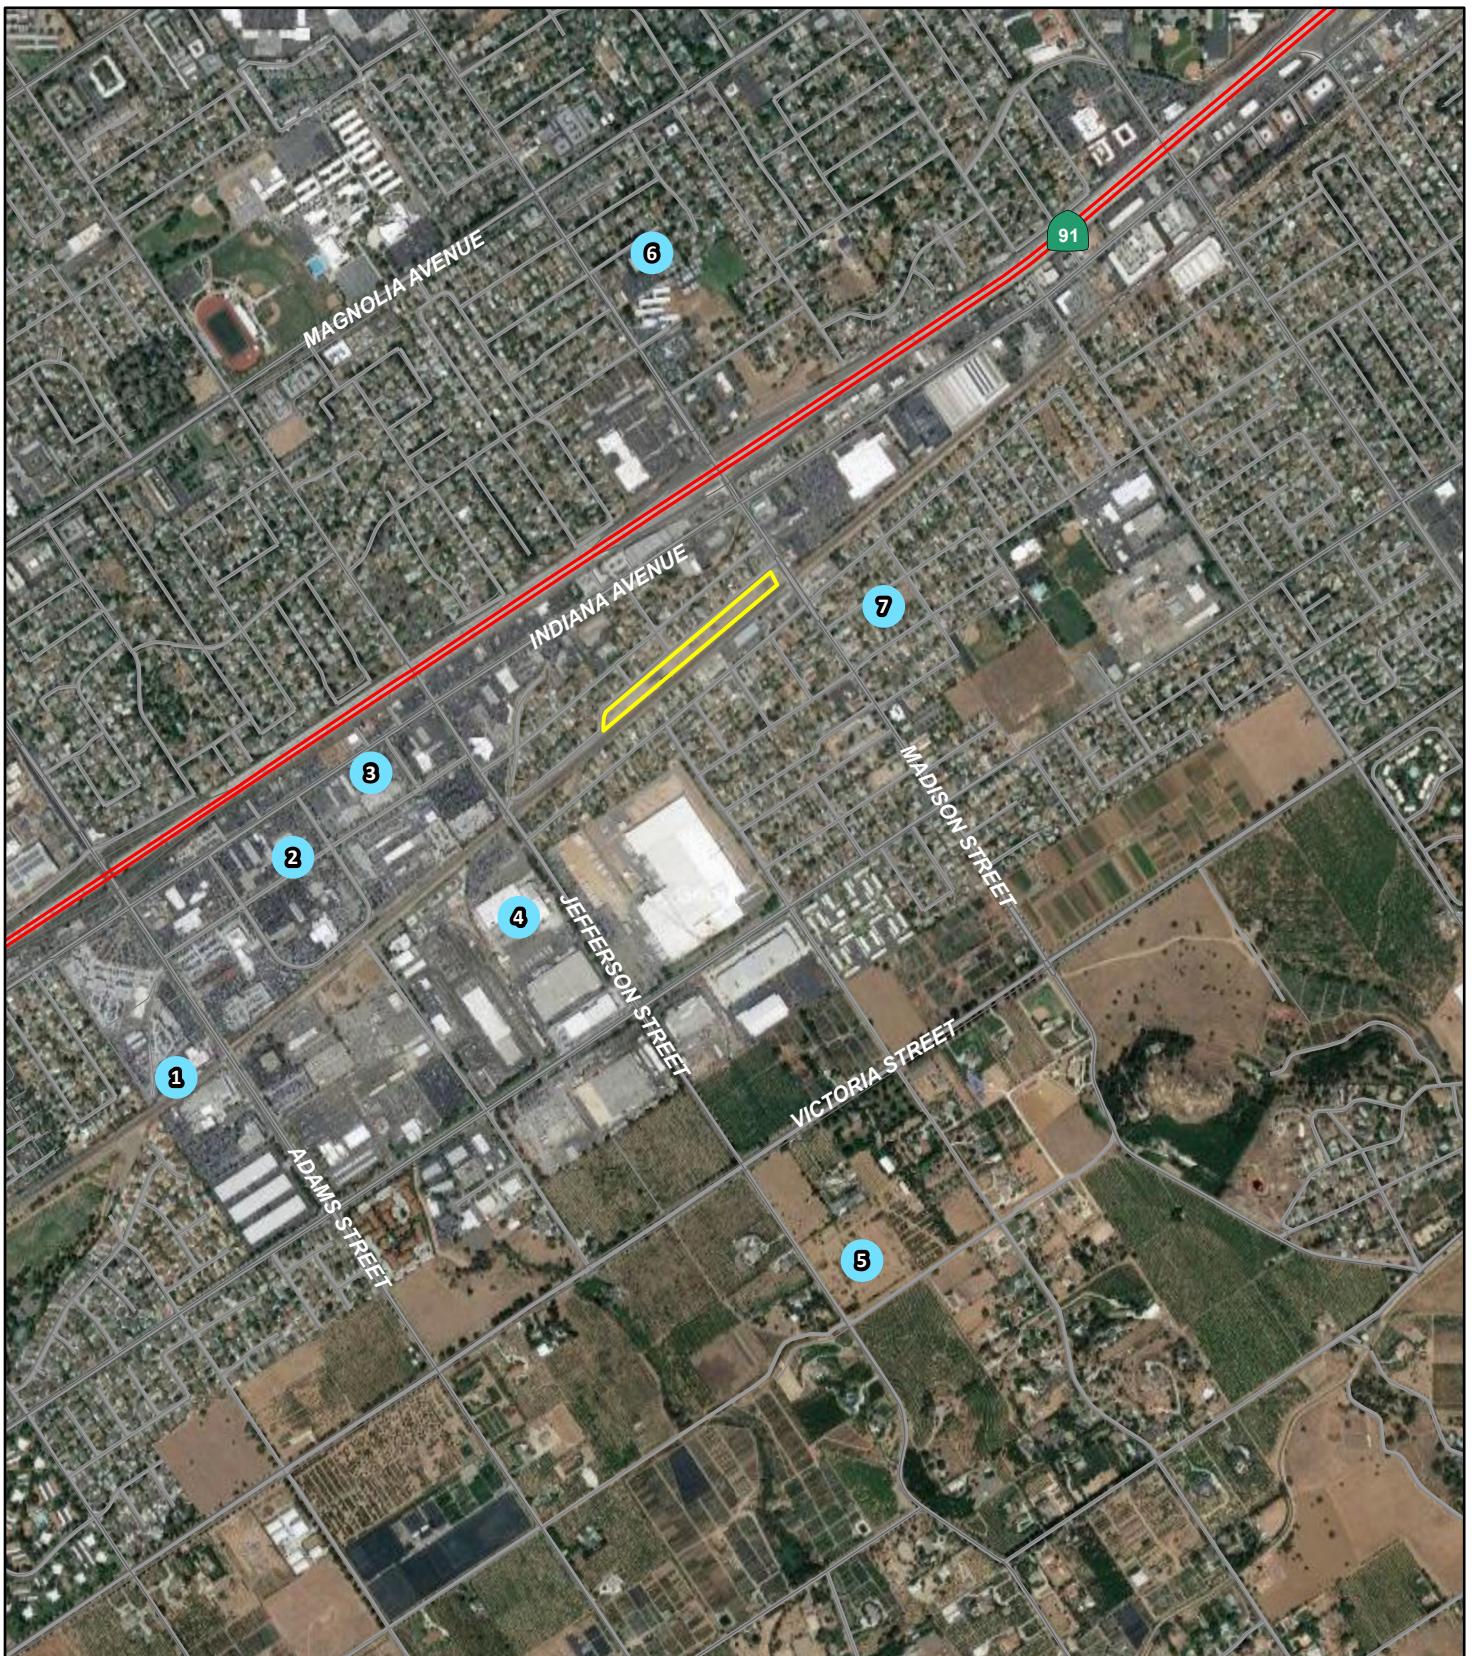

6.5.2 Roadway Segments

A roadway segment LOS analysis was conducted for opening year with project conditions using the methodologies previously discussed. Table 6-D summarizes the results of this analysis and shows that all roadway segments are forecast to operate at a satisfactory LOS.

* Exceeds LOS Standard

¹ Roadway classification has been obtained from the City of Riverside General Plan Circulation and Community Mobility Element Master Plan of Roadways.² Roadway capacity has been obtained from the City of Riverside *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled and Level of Service Assessment* (dated July 2020).³ Operational deficiency determined based on the criteria included in the City of Riverside *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled and Level of Service Assessment* (dated July 2020).

7.0 CUMULATIVE ANALYSIS

7.1 CUMULATIVE (2045) WITHOUT PROJECT TRAFFIC VOLUMES

The Riverside County Transportation Model (RIVCOM) was used to develop cumulative (2045) traffic volumes. The methodology used to develop cumulative traffic volumes is consistent with the National Cooperative Highway Research Program (NCHRP) as well as local procedures for post-processing of modeled traffic volumes. The methodology was applied to both study intersections and roadway segments.

Figure 7-1 illustrates cumulative without project peak hour traffic volumes at study intersections. Table 7-A summarizes cumulative without project daily traffic volumes at study area roadway segments.

7.2 CUMULATIVE (2045) WITH PROJECT TRAFFIC VOLUMES

Cumulative with project traffic volumes were developed by adding proposed project traffic to the cumulative without project traffic volumes.

Figure 7-2 illustrates cumulative with project peak hour traffic volumes at study intersections. Previously referenced Table 7-A summarizes cumulative with project daily traffic volumes at study area roadway segments.

Detailed volume development worksheets are included in Appendix C.

7.3 CUMULATIVE (2045) WITHOUT PROJECT LEVELS OF SERVICE

7.3.1 Study Intersections

An intersection LOS analysis was conducted for cumulative without project conditions using the methodologies previously discussed. Table 7-B summarizes the results of the analysis and shows that the following intersection is forecast to operate at an unsatisfactory LOS under cumulative year without project conditions,

2. Madison Street/Indiana Avenue (both a.m. and p.m. peak hour).

All other intersections are forecast to operate at a satisfactory LOS.

7.3.2 Roadway Segments

A roadway segment LOS analysis was conducted for cumulative without project conditions using the methodologies previously discussed. Table 7-C summarizes the results of this analysis and shows that all roadway segments are forecast to operate at a satisfactory LOS.

7.4 CUMULATIVE (2045) WITH PROJECT LEVELS OF SERVICE

7.4.1 Study Intersections

An intersection LOS analysis was conducted for cumulative with project conditions using the methodologies previously discussed. Table 7-B summarizes the results of the analysis and shows

that the following intersection is forecast to operate at an unsatisfactory LOS under cumulative with project conditions,

2. Madison Street/Indiana Avenue (both a.m. and p.m. peak hour).

This intersection is forecast to operate at an unsatisfactory LOS even under cumulative without project conditions. Therefore, the project would contribute to the forecasted deficiency at this intersection. As such, improvements would be required at this intersection.

All other intersections are forecast to operate at a satisfactory LOS under cumulative with project conditions. Detailed Level of Service Worksheets are included in Appendix D.

7.4.2 Roadway Segments

A roadway segment LOS analysis was conducted for cumulative with project conditions using the methodologies previously discussed. Table 7-C summarizes the results of this analysis and shows that all roadway segments are forecast to operate at a satisfactory LOS.

1 Roadway classification has been obtained from the City of Riverside General Plan Circulation and Community Mobility Element Master Plan of Roadways.

2 Roadway capacity has been obtained from the City of Riverside *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled and Level of Service Assessment* (dated July 2020).3 Operational deficiency determined based on the criteria included in the City of Riverside *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled and Level of Service Assessment* (dated July 2020).

8.0 QUEUING ANALYSIS

An intersection and driveway queuing analysis were requested by City staff during the scoping agreement process to ensure that adequate queuing is provided at project driveways and adjacent intersections. In case queuing deficiencies are identified, the project would need to alleviate potential queuing issues. As such, the queuing analysis was performed at the following five intersection/driveways/railroad tracks:

4. Madison Street/Railroad Avenue;
5. Project Driveway 1/Railroad Avenue;
6. Project Driveway 2/Railroad Avenue; and
7. Project Driveway 3/Railroad Avenue.

Table 8-A lists the available turn-pocket storage lengths and summarizes the 95th percentile back-of-queue lengths at the five study intersections under existing, opening year, and cumulative without and with project conditions. Intersection queues at stop-controlled intersections were reported from SimTraffic.

As shown in Table 8-A, Table 8-B, and Table 8-C, queues for all the approaches do not exceed the available turn-pocket storage length under the existing scenario nor forecasted to exceed the available turn-pocket storage length under the opening year and cumulative without and with project scenarios, respectively. As such, it is not forecasted that there will be any queuing deficiencies that will negatively affect traffic operations.

9.0 SITE ACCESS ANALYSIS

9.1 INTERSECTION SIGHT DISTANCE

Per request of City staff, a sight distance analysis was conducted at the project driveways along Railroad Avenue to evaluate safe access in and out of the project. Sight distance is the length of the visible roadway a driver can see approaching vehicles before their line of sight is blocked by any object. For purposes of this analysis, only the stopping sight distance and corner sight distance have been evaluated. That is because those are the only two sight distance issues that would affect safe maneuver of ingress/egress traffic from the project driveway.

According to the *Caltrans Highway Design Manual (HDM)* (dated July 2020), the stopping sight distance is the minimum sight distance along a roadway required to allow a driver to decrease their speed from the design speed to a complete stop. The corner sight distance is the minimum sight distance in which a driver at a stop-controlled approach can see oncoming traffic on the major street to safely maneuver onto the roadway.

The stopping sight distance was evaluated on the local street abutting the project (i.e., Railroad Avenue). The posted speed limit on Railroad Avenue is 25 mph. For purposes of this analysis, the posted speed limit has been considered as the design speed. As stated in Table 201.1 of the HDM, the minimum stopping distance is 150 feet for a design speed of 25 mph. Therefore, the minimum stopping sight distance for the project driveways have been considered as 150 feet.

As for corner sight distance, Section 405.1 of the HDM states that corner sight distance requirements are not applicable for urban driveways unless signalized. However, as a conservative approach, a corner sight distance was also evaluated for the project driveways. At the project driveways, the minimum corner sight distance was based on design speed, time gap and type of vehicles from the minor road (project driveway) to enter the major road (Railroad Avenue). Based on the requirements established in the HDM, it was determined that a minimum corner sight distance of 280 feet would be required for the project driveway. Since the corner sight distance required at the project driveways would be greater than the stopping sight distance (280 feet compared to 150 feet), a sight triangle figure was created using corner sight distance as a conservative approach.

As illustrated in Figure 9-1, the proposed Project Driveway 1 would not achieve adequate corner sight distance (and therefore stopping sight distance) for vehicles approaching the driveway in the eastbound direction or for project traffic trying to exit using this driveway. However, the project would be adding an all way stop control at this driveway as a project design feature, which will help alleviate the sight distance concern.

As illustrated in Figures 9-2 and Figure 9-3, the proposed Project Driveway 2 and Project Driveway 3 would achieve adequate corner sight distance and therefore stopping sight distance.

9.2 BICYCLE, PEDESTRIAN, AND TRANSIT ACCESSIBILITY

9.2.1 Bicycle Accessibility

As part of the City's Bikeway Network, a Class II Bike Lane has been added to both directions of Jefferson Street near the study area. A Class II Bike Lane is proposed along Lincoln Avenue near the study area. A Class III Bicycle Boulevard is also proposed along Madison Street within the study area. Since there is a planned Class III Bicycle Boulevard, it is anticipated that the majority of bicyclists will access the project site from Madison Street and Jefferson Street through Railroad Avenue.

9.2.2 Pedestrian Accessibility

Paved sidewalks are provided on both sides of Depot Street, Winstrom Street, Madison Street, Indiana Avenue, Casa Blanca Street, and Evans Street. The project will construct a paved sidewalk along the project frontage. As such, the project will improve pedestrian accessibility along Railroad Avenue. This network of sidewalks provides a direct and convenient access for residents traveling to and from their homes to nearby retail, transit, and parks. Therefore, the project is anticipated to provide adequate pedestrian safety for residents that will access the nearby amenities.

9.2.3 Transit Accessibility

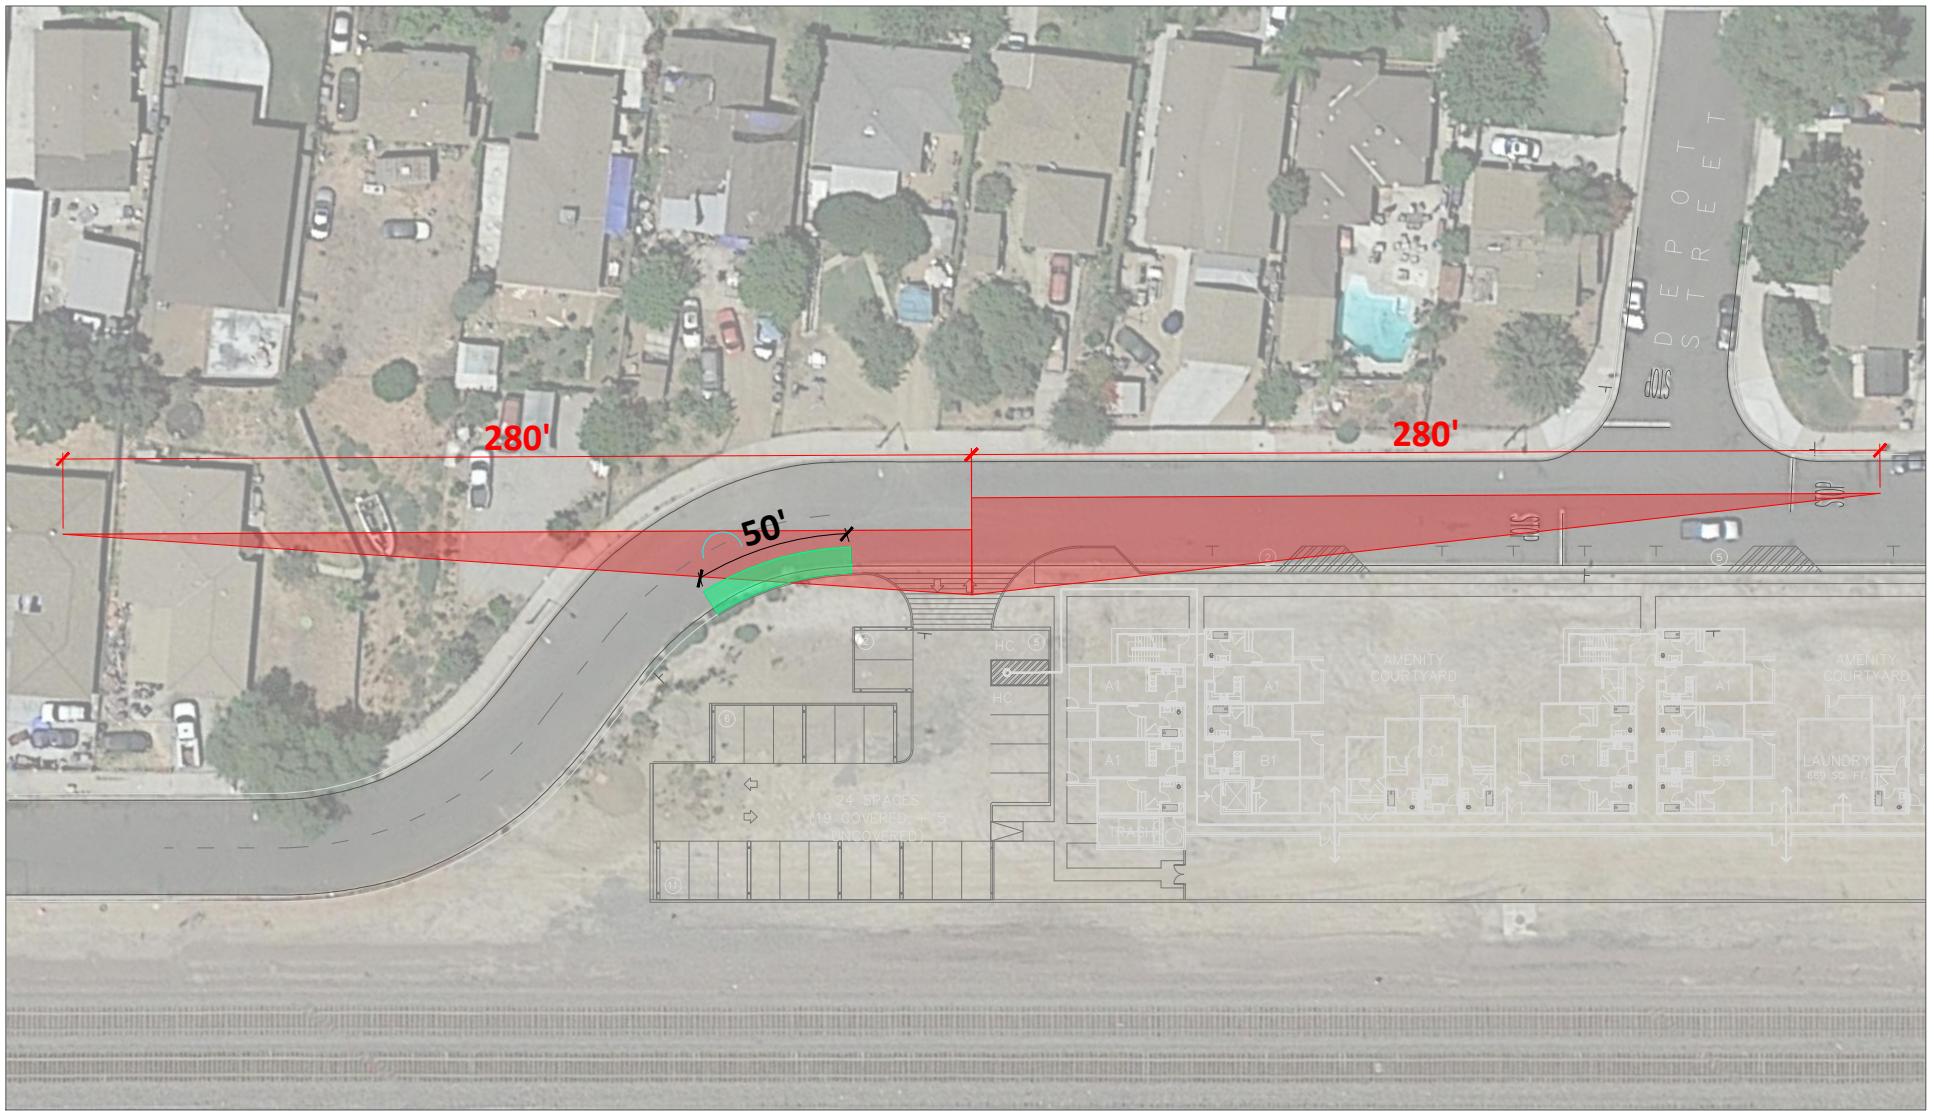

RTA local bus Route 14 serves the study area by providing connections to the Galleria at Tyler, Downtown Riverside, Downtown Riverside, Hunter Park Metrolink Station, and Loma Linda VA Hospital. There are existing bus stops located at the intersections of Winstrom Street/Indiana Avenue and Madison Street/Indiana Avenue. Crosswalks for Indiana Avenue are provided at each of these bus stop locations for safe access to the westbound route.

9.3 INTERNAL CIRCULATION

Figure 9-4 illustrates how a typical passenger vehicle would be able to turnaround at the end of the drive aisle at the western end of the project site. Additionally for all trash pick-up, the facilities/property management on site will wheel the trash bins out to Railroad Avenue on trash days for trash pick-up. There is a direct path through the parking lot area for these trash bins to be wheeled out to the street.

10.0 ACTIVE TRANSPORTATION AND PUBLIC TRANSIT ANALYSIS

According to the City's TIA Guidelines, a significant impact occurs when a project conflicts with adopted plans, policies, or programs regarding active transportation or public transit facilities, or otherwise decreases the performance or safety of such facilities.

Based on the City's PACT, adopted December 2021, at present, Class II Bike Lane have been added to both directions of Jefferson Street near the study area. A Class II Bike Lane is planned to be added along Lincoln Avenue near the study area. A Class III Bicycle Boulevard is planned to be added along Madison Street within the study area. As such, the project would not decrease the performance or safety of any existing or proposed bicycle facility.

According to the City of Riverside *General Plan Circulation Element*, sidewalks are generally provided on both sides of the streets. Additionally, standard paved trails and non-standard unpaved trails are frequently used by bicyclists and pedestrians in the City. According to the City's PACT, there is a proposed primary corridor on Victoria Avenue at the intersection with Madison Street. Although there are no current trails within the study area, paved sidewalks are provided on both sides of Depot Street, Winstrom Street, Madison Street, Indiana Avenue, Casa Blanca Street, and Evans Street. As previously referenced, the project will construct a paved sidewalk along the project frontage along Railroad Avenue. As such, the project will improve the performance and safety of the existing and proposed pedestrian facilities.

RTA local bus Route 14 currently operates within the study area. Route 14 has connections to the Galleria at Tyler, Downtown Riverside, Hunter Park Metrolink Station, and Loma Linda VA Hospital. Route 14 has stops at the intersections of Winstrom Street/Indiana Avenue and Madison Street/Indiana Avenue. Crosswalks for Indiana Avenue are provided at each these bus stop locations for safe access to the westbound route.

The project does not conflict with any existing or proposed bicycle, pedestrian, or public transit facilities. Therefore, the project can be considered to conform to all adopted policies, plans, or programs concerning these facilities and would not have a significant impact.

11.0 CIRCULATION IMPROVEMENTS AND FUNDING SOURCES

11.1 RECOMMENDED IMPROVEMENTS

Based on the results of the LOS analysis, an improvement has been recommended at the study intersection where the project is forecast to create or contribute to operational deficiencies under opening year and cumulative conditions. Table 11-A summarizes the recommended improvements for the study intersection for all analysis scenarios. Tables 11-B and 11-C summarize the post-improvement intersection levels of service under opening year and cumulative conditions, respectively.

As shown in Tables 11-B and 11-C, the intersection of Madison Street/Indiana Avenue is forecast to operate at a satisfactory LOS under the opening year and cumulative conditions with the recommended improvements.

11.2 FUNDING SOURCES AND MECHANISMS

Where there is a funding mechanism (fee program) for the recommended improvements, payment into the fee program may be considered sufficient project obligation to alleviate project-related operational deficiencies. At study intersections where the project adds to or creates a forecast deficiency and there is no funding mechanism in place, the project is responsible for its fair share payment toward the implementation of the improvements.

11.2.1 TUMF Program

The underlying purpose of the Transportation Uniform Mitigation Fee (TUMF) program is “the need to establish a comprehensive funding source to mitigate the cumulative regional transportation impacts of new development on regional arterial highways.” As new development occurs in western Riverside County, the cumulative transportation impacts of this new development are reflected in increased demand for transportation infrastructure leading to decreased levels of service, increased delay and increased congestion on regional transportation facilities, and an overall decline in regional mobility. Therefore, the need to invest in additional transportation infrastructure to meet the increased travel demand and to sustain pre-development traffic conditions to “keep traffic flowing” represents the fundamental premise of the TUMF program.

11.2.2 Project Fair Share

In the absence of a fee program, the project shall pay its fair share of the cost required to offset operational deficiencies. Since the improvements at the intersection of Madison Street/Indiana Avenue is not covered under any fee program, the project’s fair share has been calculated based on project traffic as a percentage of total growth from existing to cumulative conditions. Previously referenced Table 11-A summarizes the project’s fair share at the intersections.

11.3 LIST OF CHAPTER 11.0 TABLES

- Table 11-A: Recommended Improvements for Intersections, Funding Mechanism, and Fair Share
- Table 11-B: Opening Year (2025) with Project with Improvements Intersection Levels of Service
- Table 11-C: Cumulative (2045) with Project with Improvements Intersection Levels of Service

Table 11-A - Recommended Improvements for Intersections, Funding Mechanism, and Fair Share

Intersection	Opening Year (2025) with Project Improvements	Cumulative (2045) with Project Improvements	Funding Mechanism	Improvements Covered by TUMF	Improvements Covered by Fair Share	Fair Share Percentage ²
2 . Madison Street/Indiana Avenue	Optimize signal timing (a.m. and p.m. peak hour)	Optimize signal timing (a.m. and p.m. peak hour)	Fair Share	-	Optimize signal timings.	10.32%

Notes:

TUMF refers to the Transportation Uniform Mitigation Fee Program.

¹ Project Fair Share Percentage is the highest fair share value of the AM and PM peak hour when both peak hours require improvements, or only in the peak hour that require improvements.

² The City does not have a fair share program, therefore, the project would need to discuss with City staff the appropriate mechanism for implementation of this improvement.

Table 11-B - Project Opening Year (2025) with Project Recommended Improvements Intersection Levels of Service

Fees to be made payable to "City of Riverside" and delivered to Land Development, City Hall 3rd Floor, 3900 Main Street, Riverside, CA 92522

- 1) Scoping Agreement Fee (For all projects not screened from analysis): **\$271.00**
- 2) TIA Review (For projects with both LOS & VMT analysis of any scale, or standalone LOS analyses with over 100 vehicle trips per hour): **\$2671.02**
- 3) TIA Review (For standalone VMT analysis, or standalone LOS analyses with under 100 vehicle trips per hour): **\$1288.20**

Trip Internalization: Yes No (% Trip Discount)

Pass-By Allowance: Yes No (% Trip Discount)

Potential Screening Checks

Is your project screened from specific analyses in accordance with City Guidelines?

Is the project screened from LOS assessment? Yes No

Public Works Department

City of Arts & Innovation

LOS screening justification (see Page 6 of the guidelines): _____

Is the project screened from VMT assessment? Yes No

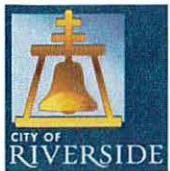

VMT screening justification (see Pages 23-25 of the guidelines): _____
Project consists of 100% affordable housing. A separate VMT memorandum will be submitted summarizing the analysis results.

Level of Service Scoping

- Proposed Trip Distribution (Attach Graphic for Detailed Distribution):

North	South	East	West
70 %	20 %	0 %	10 %

- Attach list of Approved and Pending Projects that need to be considered (provided by the lead agency and adjacent agencies)
- Attach list of study intersections/roadway segments
- Attach legible site plan
- Note other specific items to be addressed:
 - Site access
 - On-site circulation
 - Parking
 - Consistency with Plans supporting Bikes/Peds/Transit
 - Other _____
- Date of Traffic Counts November 2022
- Attach proposed analysis scenarios (years plus proposed forecasting approach)
- Attach proposed phasing approach (if the project is phased)

Public Works Department

City of Arts & Innovation

VMT Scoping

For projects that are not screened, identify the following:

- Travel Demand Forecasting Model RIVCOM
- Attach WRCOG Screening VMT Assessment output or describe why it is not appropriate for use
- Attach proposed Model Land Use Inputs and Assumed Conversion Factors (attach)

Specific Issues to be addressed in the Study (in addition to the standard analysis described in the Guidelines) (To be filled out by the Public Works Traffic Engineering Division)

1. Queuing Analysis at Project Driveways, Railroad Avenue at Madison Street.
2. Sight Distance Analysis
3. Include detailed site plan which includes parking lane width, travel lane width, right of way, curb to curb width etc. in the report.
4. Add all-way stop control at Winstrom Street/Railroad Avenue. Install a stop bar, stop legend, and stop signs at the project driveways.
5. Add speed limit signs along project frontage on Railroad Avenue.
6. While this is not part of the traffic study process, it is strongly recommended that BNSF and CPUC shall be notified regarding the proposed project and that project should start the process soon.

Analysis Scenarios

The LOS analysis for the proposed project will be prepared to meet the requirements of the City. The LOS analysis will address existing traffic conditions, future traffic forecasts, circulation deficiencies (if any), and circulation improvements. Therefore, traffic operations will be analyzed under the a.m. and p.m. peak hour at the study intersections and daily roadway conditions for the study roadway segments. The analysis will be conducted for the following five scenarios:

- Existing Conditions;
- Opening Year without Project Conditions;
- Opening Year with Project Conditions;
- Cumulative (2045) without Project Conditions; and
- Cumulative (2045) with Project Conditions.

Study Area

The study area intersections are as follows:

- Project Driveway 1/Railroad Avenue;
- Winstrom Street/Railroad Avenue;
- Project Driveway 2/Railroad Avenue;
- Project Driveway 3/Railroad Avenue;
- Madison Street/Indiana Avenue;
- Madison Street/Casa Blanca Street; and
- Madison Street/Railroad Avenue.

The study area roadway segments are as follows:

- Railroad Avenue, west of Winstrom Street;
- Railroad Avenue, between Winstrom Street and Madison Street;
- Madison Street, between Indiana Avenue and Railroad Avenue; and
- Madison Street, between Railroad Avenue and Evan Street.

Traffic Counts and Volume Development Methodology

Traffic volumes for existing conditions will be developed using existing count data collected at study intersections and roadway segments. A growth rate of 2 percent per annum will be applied to the counts to develop opening year traffic volumes. Cumulative conditions traffic volumes will be developed using forecasted growth from Riverside County Transportation Model (RIVCOM). The

methodology used to develop cumulative traffic volumes for intersections and roadway segments will be consistent with the National Cooperative Highway Research Program (NCHRP) as well as local procedures for post-processing of modeled traffic volumes.

Project VMT Analysis

The project VMT analysis will be prepared consistent with the methodologies outlined in the City's *Traffic Impact Analysis (TIA) Guidelines for Vehicle Miles Traveled and Level of Service Assessment* (dated July 2020). This project will require a General Plan Amendment (GPA). However, it should be noted that the project will fully consist of affordable housing. As such, according to the City's VMT screening criteria, it is anticipated that the project may be screened out from a full VMT analysis.

Active Transportation and Public Transit Analysis

The TIA will include an analysis of potential project impacts on public transit, bicycle, and pedestrian facilities. Significant impacts would be determined based on whether the project conflicts with adopted policies, plans, or programs for these facilities, or whether the project decreases the performance or safety of these facilities.
