Sienna Construction

C/O Fernando Nieto, Owner
5408 Brigadoon Lane, Bakersfield, CA 93312
661.303.5218
SiennaConstruction11@gmail.com

Dear Mr. Nieto,

The Soar Environmental Team is pleased to provide this Vehicle Miles Traveled (VMT) analyses Letter Report. This VMT Letter Report includes VMT analysis for the proposed light industrial development in Bakersfield, California. The project site is in Kern County, which is within the San Joaquin Valley Air Pollution Control District (SJVAPCD). These evaluations will support an Initial Study (IS) or a Mitigated Negative Declaration (MND) from the County under the California Environmental Quality Act (CEQA).

PROJECT DESCRIPTION

The proposed project is located at 185 Quantico Avenue, Bakersfield (APN 142-230-13-00-0), CA and involves the development and construction of the property for a truck maintenance shop. The maintenance shop will be conducting semi-truck repairs and dispatching activities for their own semi-truck fleet. Approximately 20 trucks, with or without trailers, will be at the maintenance shop on any given day. This includes approximately 15 trucks entering and exiting the shop, with approximately 5 trucks being parked at the shop for up to one week. The back portion of the site will be paved for longer-term storage of up to 40 trucks at any given time.

The 9-acre parcel is currently vacant; therefore, no demolition will be required. The nearest sensitive receptor is a residence adjacent to the project site to the east. The nearest school to the project site is Virginia Avenue Elementary School approximately 0.5 mile (800 meters) northeast of the project site. The nearest airport is Bakersfield Municipal Airport approximately 3 miles (4,830 meters) southwest of the property.

ASSUMPTIONS

The following basic assumptions were used in developing the emission estimates for the proposed project using CalEEMod:

- CalEEMod defaults were applied to all phases of the project, unless otherwise specified.
- Institute of Traffic Engineers (ITE) default trip distances for the San Joaquin Valley Air Basin, as contained in CalEEMod, were assumed for the operational traffic analysis.
- Some project design features including sizes and number of buildings were defined by the Applicant and replaced some CalEEMod default settings.
- CalEEMod construction timelines are generally accurate, unless otherwise stated.
- During the site preparation and grading phases of construction, it is anticipated that no soil will need to be exported from or imported to the project site.

1401 Fulton Street, Suite 918 Fresno, CA 93721
www.soarhere.com • 559.547.8884

- The default equipment from CalEEMod for each construction phase, is representative of actual construction equipment used during construction.

LIST OF TABLES

The project analyses and results are summarized in the following tables:

- Table 1: Estimated Operational Vehicle Miles Traveled Impacts

VEHICLE MILES TRAVELED IMPACTS ANALYSES

VMT Analysis Methodology

CalEEMod contains built-in Institute of Transportation Engineers (ITE) data tables (10th Edition) for determining operational trip rates for calculating vehicle miles traveled (VMT). Trip lengths are defined in

CalEEMod at the Statewide, Air Basin, Air District, and County level for rural and urban project settings. The VMT results are used for calculating mobile source emissions of criteria pollutants and GHGs using the mobile source emission factors (EMFAC) database, which is also built into CalEEMod.

Trip rates are in terms of the size metric (thousand square footage or dwelling unit) are defined in CalEEMod/ITE for the applicable land use for weekdays, Saturdays, and Sundays (if available). Trip lengths are for primary trips. Trip purposes are primary, diverted, and pass-by trips. Diverted trips are assumed to take a slightly different path than a primary trip and are assumed to be 25% of the primary trip lengths. Pass-by trips are assumed to be 0.1 miles in length and are a result of no diversion from the primary route. Residential trip types are defined as home-work (H-W), home-shopping (H-S), and home-other (H-O). Non-residential trip types are defined as commercial-customer (C-C), commercial-work (C-W), and commercial-nonwork (C-NW), such as delivery trips. (CalEEMod 2020)

In its review comments to the September 2021 report, the City's Planning Division requested an updated VMT analysis because the planned size of the building increased. As discussed below, the size increase would have no effect on the projected VMT for the proposed project:

The original design included an 11,600 square-foot prefabricated steel building; the updated design increases the size of the building by 23% to 14,300 square feet. This is the result of adding 2,700 square feet office space with no increase in office staff; only more workspace for each employee will be added. The truck shop area will be the same size, and the capacity to service up to 20 trucks per day will not increase. The additional 2,700 square feet of office space will have no effect on daily truck traffic in and out of the facility, and the same number of office workers will be commuting. Thus, the increase in building size will not result in a substantive change in the results of the VMT and related air quality and greenhouse gas analyses, and results will remain less than significant. A revised VMT analysis is unnecessary.

Project Specific Trip Rates for VMT Estimates

CalEEMod is the SJVAPCD's accepted air quality model for determining direct and indirect emissions associated with various types of land uses, which it relies on to assist in evaluating project-related emissions for employees or residents traveling to and from a project site. Yorke's evaluation was based

1401 Fulton Street, Suite 918 Fresno, CA 93721
www.soarhere.com • 559.547.8884

on the potential size of light industrial building that would be constructed on the site (i.e., prefabricated 11,600 square feet), as well as the trip generation rate (i.e., trips per 1,000 square feet or ksf of occupied building) for the potential land uses. Default trip generation rates are provided in the CalEEMod user guide, Appendix D, which are adopted from the Institute of Transportation Engineers (ITE) trip generation manual, 10th edition. As shown in Table 4.3 of Appendix D of the CalEEMod user guide, Mobile Trip Rates, Trip Purpose, Trip Type by Land Use the default single-building weekday trip generation rate for General Light Industry is 4.96 trips/ksf. To reasonably account for up to 20 heavy duty trucks serviced per day, Yorke increased the trip rate for any given day in a week to 6.90 trips/ksf (80 trips/day), allowing for heavy-heavy duty trucks (HHD) to make up 25% (20 trips/day) of the traffic fleet mix moving through the facility during operations. The balance of 60 trips/day (5.17 trips/ksf) was allocated as 20 passenger cars (LDA) and 40 light duty pickup trucks (LDT1, LDT2).

Results of VMT Analysis

The trip rates are based on ITE 10th Edition average trip rates for the respective land use categories (CalEEMod version 2020.4.0). For standard land use projects, such as residential, commercial, or industrial, the VMT values output by CalEEMod based on ITE reference data are considered generally representative. As determined with CalEEMod using default trip lengths for the land use data shown in Table 1, estimated VMT impacts are presented in Table 6.

Table 1: Estimated Operational Vehicle Miles Traveled Impacts

| Land Use | Average Daily Trip Rate | | | Annual VMT |
|------------------------|-------------------------|-----------|-----------|----------------|
| | Weekday | Saturday | Sunday | |
| General Light Industry | 60 | 60 | 60 | 175,258 |
| Heavy Duty Trucks | 20 | 20 | 20 | 58,419 |
| Total | 80 | 80 | 80 | 233,678 |

Sources: Applicant 2021, CalEEMod version 2020.4.0

Discussion

Based on projections provided by Soar, the prospective truck maintenance facility would be able to service up to 20 heavy-heavy duty (HHD) trucks per day. Operational traffic by heavy duty trucks to be serviced would represent approximately 25% of the 233,700 annual VMT shown in Table 1, with the remaining 75% available for light passenger vehicles and trucks (60 trips/day).

PROJECTED IMPACT: Less Than Significant (LTS)

MITIGATION: None Required
