1.0 INTRODUCTION

1.1 Purpose of this Study

The purpose of this Air Quality study is to determine potential significant air quality impacts (if any) that may be created by construction, area or operational emissions (short term or long term) from the proposed Project. Should impacts be determined, the intent of this study would be to recommend suitable mitigation measures to bring those impacts to a level that would be considered less than significant.

1.2 Project Location

The proposed Project site is generally located south of the intersection of Pipeline Avenue and Soquel Canyon Road in Chino Hills, CA. A project vicinity map is shown in Figure 1-A.

1.3 Project Description

The Chino Valley Fire District (CVFD) identified a significant need to build a fire station in the Soquel Canyon area of Chino Hills through a Standards of Cover Assessment and Master Plan update conducted in 2018. To support this requirement, The CVFD is proposing to construct a new fire station and emergency resource facility (ERF) which is expected to consist of approximately 18,745 square-foot in total on a 3.74 acre project site. Site improvements proposed include approximately 56,115-square-feet of hardscape including visitor and secured parking areas, 88,600 square-feet of landscaping, security fencing, concrete masonry site walls, hose tower, an emergency generator, an above ground fuel dispensing tank, and carports with PV arrays. The Project is expected to commence in early 2024 and be completed in early 2025. The project would require 14,307 Cubic Yards (CY) of export during the grading operations.

Following the construction of the Project, operations of the new Fire Station and ERF will be added to the three existing Chino Hills fire stations, under the Chino Valley Fire District in order to maintain the appropriate levels of response times to calls for service within its service area.

The Fire Department anticipate eight calls daily at the opening and forecasts as many as 12 calls per day at the peak. The site expects to operate with as little as one ladder truck or an engine company, an ambulance as well as a Battalion Chief unit. The project site plan is shown in Figure 1-B.

2.0 EXISTING ENVIRONMENTAL SETTING

2.1 Existing Setting

The project is located on two separate parcels having assessor's Parcel Numbers (APN) 1017-241-28 and 1030-341-68. The site is zoned within Planned Development PD-41-163 (Kaufman and Broad, south of Soquel Canyon Parkway). The Project site is designated under the General Plan Land Use Map as Institutional/Public Facility and Public Open Space. The Project proposes to change the portion of the designated Public Open Space to Institutional/Public Facility. The surrounding area to the east is also zoned within PD-41-163 with the single-family residential areas designated as Low Density Residential and Public Open Space.

The Mark Wickham Elementary School to the northeast is under Planned District PD-43-161 and is designated as Institutional/Public Facility. Other portions of the surrounding areas are zoned as private open space (OS-1) with low density residential (R-S) to the west, and public open space (OS-2) with low density residential (R-S) to the north.

The site topography ranges in elevation from roughly 765 feet above mean sea level (MSL) on the northeastern boundary to approximately 800 feet above MSL on the southwestern boundary.

2.2 Climate and Meteorology

The Project is located in the South Coast Air Basin (SCAB). Climate within the SCAB area often varies dramatically over short geographical distances due to the size and topography. Most of southern California is dominated by high-pressure systems for much of the year, which keeps Chino Hills mostly sunny and warm. Typically, during the winter months, the high-pressure system drops to the south and brings cooler, moister weather from the north.

It is common for inversion layers to develop within high-pressure areas, which mostly define pressure patterns over the SCAB. These inversions are caused when a thin layer of the atmosphere increases in temperature with height. An inversion acts like a lid preventing vertical mixing of air through convective overturning.

Daytime temperature highs within the City of Chino Hills typically range between 60 ºF in the winter to approximately 89 ºF in the summer with the month of August usually being the hottest month. Chino Hills usually receives an average seasonal precipitation of 21 inches of rain per year with the months of February and March usually being the wettest months of the year (City Data, 2023)

2.3 Regulatory Standards

2.3.1 Federal Standards and Definitions

The Federal Air Quality Standards were developed per the requirements of The Federal Clean Air Act, which is a federal law that was passed in 1970 and further amended in 1990. This law provides the basis for the national air pollution control effort. An important element of the act included the development of national ambient air quality standards (NAAQS) for major air pollutants.

The Clean Air Act established two types of air quality standards otherwise known as primary and secondary standards. ***Primary Standards*** set limits to protect public health which includes sensitive populations such as asthmatics, children and elderly. ***Secondary Standards*** set limits to protect public welfare and include protection against decreased visibility, damage to animals, crops, vegetation and buildings.

The Environmental Protection Agency's (EPA Office of Air Quality Planning and Standards (OAQPS) has set National Ambient Air Quality Standards (NAAQS) for principal pollutants, which are called "criteria" pollutants. These pollutants are defined below (EPA, 2022):

1. ***Carbon Monoxide (CO):*** *is a colorless, odorless, and tasteless gas and is produced from the partial combustion of carbon-containing compounds, notably in internal-combustion engines. Carbon monoxide usually forms when there is a reduced availability of oxygen present during the combustion process. Exposure to CO near the levels of the ambient air quality standards can lead to fatigue, headaches, confusion, and dizziness. CO interferes with the blood's ability to carry oxygen* (EPA, 2022).
2. ***Lead (Pb):*** *is a potent neurotoxin that accumulates in soft tissues and bone over time. The major sources of lead emissions have historically been motor vehicles (such as cars and trucks) and industrial sources. Because lead is only slowly excreted, exposures to small amounts of lead from a variety of sources can accumulate to harmful levels. Effects from inhalation of lead near the level of the ambient air quality standard include impaired blood formation and nerve conduction. Lead can adversely affect the nervous, reproductive, digestive, immune, and blood-forming systems. Symptoms can include fatigue, anxiety, short-term memory loss, depression, weakness in the extremities, and learning disabilities in children* (EPA, 2022).
3. ***Nitrogen Dioxide (NO_2):*** *is a reactive, oxidizing gas capable of damaging cells lining the respiratory tract and is one of the nitrogen oxides emitted from high-temperature combustion, such as those occurring in trucks, cars, power plants, home heaters, and gas stoves. In the presence of other air contaminants, NO_2 is usually visible as a reddish-brown air layer over urban areas. NO_2 along with other traffic-related pollutants is associated with*

respiratory symptoms, respiratory illness and respiratory impairment. Studies in animals have reported biochemical, structural, and cellular changes in the lung when exposed to NO_2 above the level of the current state air quality standard. Clinical studies of human subjects suggest that NO_2 exposure to levels near the current standard may worsen the effect of allergens in allergic asthmatics, especially in children (EPA, 2022).

4. ***Particulate Matter (PM_{10} or $PM_{2.5}$):*** *is a complex mixture of tiny particles that consists of dry solid fragments, solid cores with liquid coatings, and small droplets of liquid. These particles vary in shape, size and chemical composition, and can be made up of multiple materials such as metal, soot, soil, and dust. PM_{10} particles are 10 microns (µm) or less and $PM_{2.5}$ particles are 2.5 (µm) or less. These particles can contribute significantly to regional haze and reduction of visibility in California. Exposure to PM levels exceeding current air quality standards increases the risk of allergies such as asthma and respiratory illness* (EPA, 2022).
5. ***Ozone (O_3)****: Ozone at the ground level is a highly oxidative unstable gas capable of damaging the linings of the respiratory tract. This pollutant forms in the atmosphere through reactions between chemicals directly emitted from vehicles, industrial plants, and many other sources. Exposure to ozone above ambient air quality standards can lead to human health effects such as lung inflammation, tissue damage and impaired lung functioning. Ozone can also damage materials such as rubber, fabrics and plastics* (EPA, 2022).

   It should be noted that Oxides of Nitrogen (NO_x) is a family of poisonous, highly reactive gases. These gases form when fuel is burned at high temperatures. NO_x pollution is emitted by automobiles, trucks and various non-road vehicles (e.g., construction equipment, boats, etc.) as well as industrial sources such as power plants, industrial boilers, cement kilns, and turbines. NO_x often appears as a brownish gas. It is a strong oxidizing agent and plays a major role in the atmospheric reactions with Volatile Organic Compounds (VOCs) which produces ozone on hot summer days (EPA, 2023).
6. ***Sulfur Dioxide (SO_2)****: is a gaseous compound of sulfur and oxygen and is formed when sulfur-containing fuel is burned by mobile sources, such as locomotives, ships, and off-road diesel equipment. SO_2 is also emitted from several industrial processes, such as petroleum refining and metal processing. Effects from SO_2 exposures at levels near the one-hour standard include bronchoconstriction accompanied by symptoms, which may include wheezing, shortness of breath and chest tightness, especially during exercise or physical activity. Children, the elderly, and people with asthma, cardiovascular disease or chronic lung disease (such as bronchitis or emphysema) are most susceptible to these symptoms. Continued exposure at elevated levels of SO_2 results in increased incidence of pulmonary symptoms and disease, decreased pulmonary function, and increased risk of mortality* (EPA, 2022).

2.3.2 State Standards and Definitions

The State of California Air Resources Board (ARB) sets the laws and regulations for air quality at State level. The California Ambient Air Quality Standards (CAAQS) are either the same as or more restrictive than the NAAQS in that the State standards also restrict four additional contaminants. Table 2.1 on the following page identifies both the NAAQS and CAAQS. The additional contaminants as regulated by the CAAQS are defined below:

1. ***Visibility Reducing Particles****: Particles in the Air that obstruct the visibility* (CARB, 2023).
2. ***Sulfates****: are salts of Sulfuric Acid. Sulfates occur as microscopic particles (aerosols) resulting from fossil fuel and biomass combustion. They increase the acidity of the atmosphere and form acid rain* (CARB, 2023).
3. ***Hydrogen Sulfide (H_2S)****: is a colorless, toxic and flammable gas with a recognizable smell of rotten eggs or flatulence. H_2S occurs naturally in crude petroleum, natural gas, volcanic gases, and hot springs. Usually, H_2S is formed from bacterial breakdown of organic matter. Exposure to low concentrations of hydrogen sulfide may cause irritation to the eyes, nose, or throat. It may also cause difficulty in breathing for some asthmatics. Brief exposures to high concentrations of hydrogen sulfide (greater than 500 ppm) can cause a loss of consciousness and possibly death* (CARB, 2023).
4. ***Vinyl Chloride****: also known as chloroethene and is a toxic, carcinogenic, colorless gas with a sweet odor. It is an industrial chemical mainly used to produce its polymer, polyvinyl chloride (PVC)* (CARB, 2023).

Table 2.1: Ambient Air Quality Standards

Ambient Air Quality Standards						
Pollutant	**Average Time**	**California Standards[1]**		**Federal Standards[2]**		
		Concentration[3]	Method[4]	Primary[3,5]	Secondary[3,6]	Method[7]
Ozone (O_3)[8]	1 Hour	0.09 ppm (180 µg/m3)	Ultraviolet Photometry	-	Same as Primary Standard	Ultraviolet Photometry
	8 Hour	0.070 ppm (137 µg/m3)		0.070 ppm (137 µg/m3)		
Respirable Particulate Matter (PM10)[9]	24 Hour	50 µg/m3	Gravimetric or Beta Attenuation	150 µg/m3	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	20 µg/m3		-		
Fine Particulate Matter (PM2.5)[9]	24 Hour	No Separate State Standard		35 µg/m3	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	12 µg/m3	Gravimetric or Beta Attenuation	12.0 µg/m3	15 µg/m3	
Carbon Monoxide (CO)	8 hour	9.0 ppm (10mg/m3)	Non-Dispersive Infrared Photometry (NDIR)	9 ppm (10 mg/m3)	-	Non-Dispersive Infrared Photometry
	1 hour	20 ppm (23 mg/m3)		35 ppm (40 mg/m3)		
	8 Hour (Lake Tahoe)	6 ppm (7 mg/m3)		-	-	-
Nitrogen Dioxide (NO_2)[10]	Annual Arithmetic Mean	0.030 ppm (57 µg/m3)	Gas Phase Chemiluminescence	0.053 ppm (100 µg/m3)[8]	Same as Primary Standard	Gas Phase Chemiluminescence
	1 Hour	0.18 ppm (339 µg/m3)		0.100 ppm[8] (188/ µg/m3)	-	
Sulfur Dioxide (SO_2)[11]	Annual Arithmetic Mean	-	Ultraviolet Fluorescence	0.030 ppm[10] (for Certain Areas)	-	Ultraviolet Flourescence; Spectrophotometry (Pararoosaniline Method)[9]
	24 Hour	0.04 ppm (105 µg/m3)		0.14 ppm[10] (for Certain Areas) (See Footnote 9)	-	
	3 Hour	-		-	0.5 ppm (1300 µg/m3)	
	1 Hour	0.25 ppm (655 µg/m3)		75 ppb (196 µg/m3)	-	
Lead[12,13]	30 Day Average	1.5 µg/m3	Atomic Absorption	-		-
	Calendar Quarter	-		1.5 µg/m3	Same as Primary Standard	High Volume Sampler and Atomic Absorption
	Rolling 3-Month Average	-		0.15 µg/m3		
Visibility Reducing Particles	8 Hour	See footnote 14				
Sulfates	24 Hour	25 µg/m3	Ion Chromatography			
Hydrogen Sulfide	1 Hour	0.03 ppm (42 µg/m3)	Ultraviolet Fluorescence			
Vinyl Chloride[12]	24 Hour	0.01 ppm (26 µg/m3)	Gas Chromatography			

1. California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, and particulate matter (PM10, PM2.5, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.
2. National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM10, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m3 is equal to or less than one. For PM2.5, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact the U.S. EPA for further clarification and current national policies.
3. Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.
4. Any equivalent procedure which can be shown to the satisfaction of the CARB to give equivalent results at or near the level of the air quality standard may be used.
5. National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.
6. National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
7. Reference method as described by the EPA. An "equivalent method" of measurement may be used but must have a "consistent relationship to the reference method" and must be approved by the EPA.
8. On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.
9. On December 14, 2012, the national annual PM2.5 primary standard was lowered from 15 µg/m3 to 12.0 µg/m3 . The existing national 24- hour PM2.5 standards (primary and secondary) were retained at 35 µg/m3 , as was the annual secondary standard of 15 µg/m3 . The existing 24-hour PM10 standards (primary and secondary) of 150 µg/m3 also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.
10. To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.
11. On June 2, 2010, a new 1-hour SO2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO2 national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.
12. The CARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.
13. The national standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard (1.5 µg/m3 as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.
14. In 1989, the CARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

Source: (California Air Resources Board, 5/4/2016)

2.3.3 Regional Standards

The State of California has 35 specific air districts, which are each responsible for ensuring that the criteria pollutants are below the NAAQS and CAAQS. Air basins that exceed either the NAAQS or the CAAQS for any criteria pollutants for designated periods defined in the footnote of Table 2.1 above are designated as "non-attainment areas" for that pollutant. Currently, there are 15 non-attainment areas for the federal ozone standard and two non-attainment areas for the $PM_{2.5}$ standard. The state therefore created the California State Implementation Plan (SIP), which is designed to provide control measures needed for California Air basins to attain ambient air quality standards.

The SCAQMD has jurisdiction over an area of approximately 10,743 square miles, consisting of the SCAB, and the Riverside County portions of the Salton Sea Air Basin (SSAB) and Mojave Desert Air Basin (MDAB). The district prepares Air Quality Management Plans (AQMP) to demonstrate how the region will reduce air pollution emissions to meet the federal and state health-based standards to comply with Clean Air Act requirements and will be ultimately a part of the SIP. The SCAQMD just updated and adopted their AQMP (SCAQMD, 2022).

The latest AQMP identifies the path South Coast Air Basin must take for the attainment of federal PM and ozone standards and highlights the significant amount of reductions needed and the urgent need to engage in interagency coordinated planning to identify additional strategies, especially in the area of mobile sources, to meet all federal criteria pollutant standards within the timeframes allowed under the federal Clean Air Act. The plan also includes a number of measures to incorporate NOx reduction requirements which would be necessary to achieve attainment in the future.

The City of Chino Hills Valley lies within the SCAB. The SCAQMD is the government agency, which regulates sources of air pollution within the City of Chino Hills. A complete listing of the current attainment status by pollutants for the SCAB is shown on Table 2.2.

Table 2.2: South Coast Air Basin Attainment Status by Pollutant

County Air Basin Attainment Status by Pollutant			
Pollutant	Average Time	California Standards	Federal Standards
Ozone (O_3)	1 Hour	Non-attainment	Nonattainment (Extreme)
	8 Hour		
Respirable Particulate Matter (PM10)	24 Hour	Non-attainment	Serious Nonattainment
	Annual Arithmetic Mean		Serious Nonattainment
Fine Particulate Matter PM2.5	24 Hour	No State Standard	Non-attainment
	Annual Arithmetic Mean	Non-attainment	Non-attainment
Carbon Monoxide (CO)	8 hour	Attainment	Attainment Maintenance[1]
	1 hour		
Nitrogen Dioxide (NO_2)	Annual Arithmetic Mean	No State Standard	Attainment
	1 Hour	Non-attainment	No Federal Standard
Sulfur Dioxide (SO_2)	Annual Arithmetic Mean	No State Standard	Attainment
	24 Hour	Attainment	Attainment
	1 Hour	Attainment	No Federal Standard
Lead	30 Day Average	Attainment	No Federal Standard
	Calendar Quarter	No State Standard	Attainment

1. Maintenance Area (defined by U.S. Department of Transportation) is any geographic region of the United States previously designated nonattainment pursuant to the CAA Amendments of 1990 and subsequently redesignated to attainment subject to the requirement to develop a maintenance plan under section 175A of the CAA, as amended.

2.4 California Environmental Quality Act (CEQA) Significance Thresholds

The California Environmental Quality Act has provided a checklist to identify the significance of air quality impacts. These guidelines are found in the most recent CEQA guidelines Appendix G (California, 2018):

AIR QUALITY -- Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the Project:

A: Conflict with or obstruct implementation of the SCAQMD AQMP or applicable portions of the State Implementation Plan (SIP)?

B: Result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is non-attainment under an applicable Federal or State ambient air quality standard.

C: Expose sensitive receptors (including, but not limited to, schools, hospitals, resident care facilities, or day-care centers) to substantial pollutant concentrations?

D: Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

2.5 Air Quality Impact Assessment Screening Thresholds

To determine whether a project would create potential air quality impacts, the City of Chino Hills uses South Coast Air Quality Management District's (SQAQMD) Screening Level Thresholds[1] (SLTs) for use in determining CEQA air quality impacts. The screening thresholds for construction and daily operations are shown in Table 2.3 below.

Demonstrating a projects compliance with SCAQMD Screening thresholds are a significant part of demonstrating compliance with SCAQMDs AQMP and is critical to insuring less than significant impacts to questions A and B identified in section 2.4 above. In addition, since SLTs were developed to align with attainment of both state and federal standards for the purpose of long term health, minimizing Project emissions to levels less than these screening thresholds is the impetus to reducing the magnitude of long-term air quality impacts from emissions of criteria pollutants and ozone precursors to less than significant.

Table 2.3: Screening Threshold for Criteria Pollutants

Pollutant	Total Emissions (Pounds per Day)
Construction Emissions	
Respirable Particulate Matter (PM_{10} and $PM_{2.5}$)	150 and 55
Nitrogen Oxide (NO_x)	100
Sulfur Oxide (SO_x)	150
Carbon Monoxide (CO)	550
Volatile Organic Compounds (VOCs)	75
Operational Emissions	
Respirable Particulate Matter (PM_{10} and $PM_{2.5}$)	150 and 55
Nitrogen Oxide (NO_x)	55
Sulfur Oxide (SO_x)	150
Carbon Monoxide (CO)	550
Lead and Lead Compounds	3.2
Volatile Organic Compounds (VOCs)	55

[1] SCAQMD SLTs are tied to achieving or maintaining attainment designations with the NAAQS and CAAQS. The federal and State ambient air quality standards, in turn, are scientifically substantiated, numerical concentrations of criteria air pollutants considered to be protective of human health. Projects generating emissions exceeding SLTs have a potential to increase human health risks and should be avoided as was established by the California Supreme Court through its decision in Sierra Club v. County of Fresno (226 Cal.App.4th 704).

2.6 Local Air Quality

Criteria pollutants are measured continuously throughout the SCAB. This data is used to track ambient air quality patterns throughout the surrounding area. As mentioned earlier, this data is also used to determine attainment status when compared to the NAAQS and CAAQS. The SCAPCD is responsible for monitoring and reporting monitoring data. The District operates approximately 30 monitoring sites that collected data on criteria pollutants within the SCAB.

Ambient Data was obtained from the California Environmental Protection Agency's Air Resources Board Website (California Air Resources Board, 2021). Table 2.4 identifies the criteria pollutants monitored closest to the Project site which is the Upland monitoring station located at 1350 San Bernardino Road in the City of Upland.

Table 2.4: Three-Year Ambient Air Quality Summary near the Project Site

Pollutant	Ambient Monitoring Site	Averaging Time	CAAQS	NAAQS	2019	2020	2021
O_3 (ppm)	upland	1 Hour	0.09 ppm	-	0.131	0.158	0.124
		8 Hour	0.070 ppm	0.075 ppm	0.107	0.123	0.100
PM_{10} (µg/m^3)		24 Hour	50 µg/m^3	150 µg/m^3	125.9	174.8	124.3
		Annual Arithmetic Mean	20 µg/m^3	-	29.0	33.5	32.6
$PM_{2.5}$ (µg/m^3)	San Bernardino – 4th Street	24 Hour	-	35 µg/m^3	91.1	74.0	83.8
		Annual Arithmetic Mean	12 µg/m^3	15 µg/m^3	Data Not Provided	Data Not Provided	Data Not Provided
NO_2 (ppm)		Annual Arithmetic Mean	0.030 ppm	0.053 ppm	Data Not Provided	0.013	0.014
		1 Hour	0.18 ppm	-	0.057	0.055	0.065

All ambient emissions reported are assumed to be taken by the district in compliance with both the NAAQS and CAAQS. Methodologies for those measurements are discussed in Table 2.1 of this report.

2.7 Localized Significance Thresholds

In June 2003 the SCAQMD proposed a methodology for calculating LSTs for NO_2, CO, $PM_{2.5}$ and PM_{10}. The LST methodology was developed to be used as a tool to assist lead agencies to analyze localized impacts associated with project-specific level proposed projects and would not be applicable to regional projects such as general plans. The LST methodology was last updated to incorporate the most recent ambient air quality standards (July 2008). (South Coast Air Quality Management District, 2008). The LST methodology is often utilized by most agencies governed under SCAQMD CEQA review. SCAQMD developed mass rate look-up tables for projects to assist agencies with development of LSTs (South Coast Air Quality Management District, 2014).

Per the requirements of SCAQMDs LSTs methodology, emissions for gases in attainment such as NO_2 and CO are calculated by adding emission impacts from the project development to the peak background ambient NO_2 and CO concentrations and comparing the total concentration to the most stringent ambient air quality standards. Also, according to SCAQMD Rule 403, emissions for non-attainment particulate matter such as PM 10 and PM 2.5 can produce no more than 10.4 $\mu g/m^3$. The LSTs derived by SCAQMD differentiated by Source Receptor area for which the proposed project is would be represented by SRA #33 within the Southwest San Bernardino area. The project was analyzed using a construction schedule where all buildings are under construction simultaneously using the appropriate equipment and quantities for this scenario with a 2-acre disturbed area. Table 2/5 below shows the worst case project LST at 25 meters (SCAQMD, 2009).

Table 2.5: LST Emission Thresholds (2-Acre Site)

Pollutant	LST @ 25 meters (lb/day)
CO	1,232
PM_{10} (Construction)	6
PM_{10} (Operation)	2
$PM_{2.5}$ (Construction)	5
$PM_{2.5}$ (Operation)	2
NO_2 (Corrected utilizing NO_2/NO_x Ratio) Construction and Operation	170

3.0 METHODOLOGY

3.1 Construction Emissions Calculations

Air Quality impacts related to construction and daily operations were calculated using the CalEEMod 2020.4.0 air quality model, which was developed by Breeze Software for SCAQMD in 2021. Emissions from the construction phase of the project were estimated using the CalEEMod Model, Version 2020.4.0[2] which is a conservative air quality model in the CalEEMod lineup.

CalEEMod relies on the total area of the site and estimates site disturbance based on the maximum acres that can be graded given the construction equipment input in an 8-hour day. The construction module in CalEEMod is used to calculate the emissions associated with the construction of the project. Construction emissions have several different types of sources which contribute to emissions of pollutants. These source types include off-road equipment usage, on-road vehicle travel, fugitive dust, architectural coating, and paving off-gassing. The CalEEMod construction module also uses OFFROAD2011 for default emission rates for construction equipment. The CalEEMod input/output model is shown in ***Attachment A*** to this report.

Fugitive dust calculations for grading within CalEEMod are based on methodologies described in Section 11.9, Western Surface Coal Mining, of the USEPA AP-42 which estimates the emission factor of PM_{10} applying a scaling factor to that of PM15. Similarly, the emission factor of $PM_{2.5}$ is scaled from that of total suspended particulates (TSP). This methodology was adopted by SCAQMD as the preferred method for fugitive dust emissions calculations. This method utilizes maximum area method based on assumed disturbed grading areas.

Significant health risks or increased risks of cancerous and non-cancerous health problems can occur when sensitive receptors (i.e., Schools, Daycares, or Residential Care Facilities) are exposed to Toxic Air Contaminants (TAC) for a significant quantity of time. Normally these impacts are analyzed over a period of 9, 30 or 70 years of continuous exposure or what is typically referred to as full lifetime and encompasses periods of potentially increased

[2] Since the analysis was started, an updated version of CalEEMod has been released by SCAQMD. The updated version of the model Version 2022.1.1.14 is the latest update to CalEEMod and brings a new web-based platform, with many new features and components, such as a geospatial interface, location-specific vehicle miles traveled analysis, climate risks analysis, and health and equity. These significant updates enable CalEEMod to deliver enhanced analysis of GHG and criteria pollutant emissions and support local governments to better address climate change, public health, and equity. The latest version of CalEEMod includes construction equipment emission factors from OFFROAD 2017-ORION Version 1.0.1, which takes into account phaseout of older equipment and additional control measures. Mobile source emissions were calculated using EMFAC2021, which also includes phaseout of older vehicles and updated emission control measures. The 2020 version of CalEEMod provides a more conservative and consistent estimate of emissions for the project because it does not include the additional control measures included in the updated version which has been updated 30 times since it was released.

susceptibility to adverse health effects from chemical exposure, particularly during infancy, childhood and the later years of life. From a practical standpoint, chronic exposure for humans is considered to be greater than 12% of a lifetime of 70 years or at least 8 years in 70 (Office of Environmental Health Hazard Assessment, August 2003).

Health risks are analyzed for projects by completing air dispersion models for diesel particulates matter (DPM) released onsite from diesel equipment onsite and using the dispersed emissions at nearby sensitive receptors to determine if cancer risks are increased to greater than 10 in one million. If this increased risk is greater than 10, the project would be required to implement toxics best available control technology (T-BACT) or impose the most effective emission limitation, emission control device or control technique to reduce the cancer risk. Generally, this requires using equipment that has diesel particulate filters installed on the exhaust stacks of the equipment or specialized equipment designed to limit diesel particulates.

The United States EPA first began adopting emission standards for Non- Road Diesel Engines in 1994. The standards are published in the US Code of Federal Regulations, Title 40, Part 89. The regulations are better known as the Tier 1-4 standards with each Tier generally requiring more stringent emission standards for diesel engines. Originally, this was limited to equipment sizes exceeding 50 HP. However, in 1998, Tier 1 regulations were also adopted for equipment under 50 HP and more stringent Tier 2 and Tier 3 standards for all equipment have been phased in from 2000 to 2008. The Tier 1-3 standards are met through advanced engine design, with no or only limited use of exhaust gas after treatment (oxidation catalysts) (DieselNet, 2013). It should also be noted that Tier 3 standards only apply to engines greater than 50 HP and Tier 1 and -2 standards are required for all portable engines.

On May 11, 2004, the EPA signed the final rule introducing Tier 4 emissions standards, which are to be phased in over the period of 2008-2015 under Federal Register 69 FR 38957-39273 (US EPA, 2004). The requirements of Tier 4 standards require that emissions of PM and NOx be further reduced by 90% which can be achieved through control technologies including advanced exhaust gas after treatment.

To simplify matters, the CVFD has indicated that all construction equipment would be Tier 4 rated since Tier 4 equipment is common and sensitive receptors are adjacent to the Project site. Given this, construction health risk impacts from diesel particulates would be less than significant.

Chronic Non-Cancer risks are also known with respect to diesel particulate matter (DPM) and are determined by the hazard index. To calculate hazard index, DPM concentration is divided by its chronic Reference Exposure Levels (REL). Where the total equals or exceeds one, a health hazard is presumed to exist. RELs are published by the Office of Environmental Health

Hazard Assessment (OEHHA, February 2015). Diesel Exhaust has a REL of 5 µg/m^3 and targets the respiratory system. Non-Cancer risks would also be less than significant since the Project would use Tier 4 construction equipment.

3.2 Construction Assumptions

Pending approval, the Project is expected to kick off construction in early 2024 with full buildout expected roughly one year later in 2025. The project site has some development onsite consisting of multiple buildings. To minimize dust and construction diesel particulate emissions, the project will wet the construction site at least three times daily and utilize Tier 4 diesel construction equipment. Table 3.1 shows the expected timeframes as well as the expected number of pieces of equipment to complete the project for the scenario identified.

Table 3.1: Proposed Construction Phase and Duration

This equipment list is based upon equipment inventory and estimates within CalEEMod 2020.4.0.			

3.3 Project Operations

Based on the projected traffic volumes by the Project Traffic Study, the proposed project would generate as much as 87 average daily traffic (ADT) (LL&G, 2023). CalEEMod was updated to reflect these trips once fully operational.

Operational air quality emission sources would also include area sources such as landscaping, consumer products and architectural coatings during maintenance, energy sources from natural gas and electrical usage, mobile sources from vehicular traffic to include trucks and passenger vehicles, solid waste from trash generation, and water uses, which are calculated within CalEEMod.

3.4 Fire Truck Operational Emissions

The fire station expects as many as 12 calls per day once fully operational. Each call could include an ambulance, a fire truck, a ladder truck or perhaps all three. For the purposes of this analysis, it is assumed that all 12 calls would include as many as three heavy diesel trucks each.

These trucks would be a mixture of heavy-heavy duty trucks (HHD) or trucks over 26,000 lbs and medium-heavy duty trucks (MHD) or trucks between 14,000 and 26,000 lbs. For the purposes of this analysis, it's assumed that all truck trips are HHDT trucks. In addition, it's assumed that each truck would idle onsite daily. Based on discussions with the CVFD, idling wouldn't be expected for more than two to three minutes daily to ensure trucks are operational for any emergency services required. As noted in Section 3.1, DPM is a known carcinogen and based on projected operations, it's suggested that project generated health risks be calculated at expected sensitive residential receptors.

CalEEMod includes mobile emissions reported within the EMFAC 2017 emission model in terms of both driving and idling emissions for each respective vehicle class from each scenario year and adjusted in units of grams per VMT. Similarly, idling emissions were divided by the number of trips to derive emission factors in units of grams per trip. Idling emissions are multiplied by the number of trips times the respective emission factor (CAPCOA, 2021).

Based on CalEEMod, the following Emission Factors are used within this analysis. Table 3.2 below shows that the truck movement PM_{10} exhaust would be generated at a rate of 0.0255 grams/VMT and Idling events would generate 0.0029 grams per trip.

Table 3.2: Operational Truck Emission Rates

EMFAC2017 Acronyms for Each Vehicle Emission	EMFAC2017 Description of Each Vehicle	EMFAC2017 Emission Rate Unit	CalEEMod Emission Factor Unit	HHD Emissions
PM10_RUNEX	Running Exhaust	grams/VMT	grams/VMT	0.025521
PM10_IDLEX	Idle Exhaust	grams/vehicle/day	grams/trip	0.002913

Cancer risks would be calculated in a similar fashion to those explained within Section 3.1 of this report. Air dispersion modeling utilizing AERMOD is the preferred dispersion modeling for projects with a high number of sources and will be used within the analysis. A screenshot graphical representation of the modeling locations is shown on an aerial below in Figure 3-A on the following page. The idling trucks are identified as light blue dots of which seven were assumed. This means that up to seven trucks were assumed onsite and outside with an idling event conducted each morning for 2-3 minutes each to ensure equipment is operating properly. It should be noted that discussions with CVFD, these idling events would typically be within the indoor parking garages but were assumed to occur outside as a worst-case operations event as it relates to the Projects potential to expose nearby receptors to Project generated DPM. In addition, all calls were assumed to have three trucks leave the site for each call.

All truck movement is represented as volume sources (identified as red squares) and a route was selected so that each vehicle would leave the site and then return passing the closest sensitive receptors such as the nearby school and residential units. Also, six sensitive receptors were added to determine operational emissions at discrete sensitive receptor locations (nearest homes and the nearby school) and are represented by red circles with the modeled receptor number used in AERMOD.

As noted above, chronic non-cancer risks can be expected when RELs exceed 5 µg/m^3. Chronic non-cancer risks can be calculated from AERMOD outputs. It should be noted that OEHHA does not classify DPM as a source for acute health risks.

3.5 Odor Impacts (Onsite)

Potential onsite odor generators would include short term construction odors from activities such as paving and possibly painting. The construction odors would be considered short term and would not be considered an impact. Given this, the Project will not create offensive odors and would therefore not be considered an impact under CEQA. The site would not generate operational odors and therefore would have a less than significant long term odor impact.

Figure 3-A: AERMOD Modeling Sources and Receptors - Onsite Operations

4.0 FINDINGS

4.1 Construction Findings

Based on the input parameters and construction design features identified in Section 3.2 of this report, no significant construction impacts are expected. Table 4.1 shows the calculated emissions from construction.

Table 4.1: Expected Construction Emissions Summary

Year	ROG	NO_x	CO	SO_2	PM_{10} (Dust)	PM_{10} (Exhaust)	PM_{10} (Total)	$PM_{2.5}$ (Dust)	$PM_{2.5}$ (Exhaust)	$PM_{2.5}$ (Total)
2024 (lb/day)	11.51	5.99	34.97	0.06	5.93	0.05	5.98	2.85	0.05	2.90
2025 (lb/day)	11.49	3.84	34.82	0.06	0.70	0.02	0.72	0.19	0.02	0.20
Significance Threshold (lb/day)	**75**	**100**	**550**	**150**	**-**	**-**	**150**	**-**	**-**	**55**

Exceeds Thresholds?	**No**	**No**	**No**	**No**	**-**	**-**	**No**	**-**	**-**	**No**
Expected Construction emissions are based upon CalEEMod modeling assumptions for equipment and durations listed in Table 2 above using Tier 4 equipment and wetting the site three times daily.										

4.2 Operational Findings

Once construction is completed the proposed project would generate air quality emissions from daily operations which are calculated within CalEEMod. Based on the estimated emissions output parameters identified in Section 3.3 of this report, a less than significant impact operational impacts would be expected. Operational emissions are shown in Table 4.2. It should be noted that these emissions include operations of fire trucks as well per the Project traffic analysis.

Daily pollutant generation assumes trip distances within CALLEEMOD						

4.3 Operational Health Risks

The proposed Fire Station is forecasted to have as many as 12 calls per day and for the purposes of this analysis, it's assumed that each call would have as many as three diesel trucks leaving the site. In addition, it's assumed that as many as 7 trucks daily onsite will idle for a few minutes each morning.

Utilizing the AERMOD dispersion model, a visual representation of the dispersed emissions output was created and shown in Figure 4-A. Specific modeled emissions for each discreet receptor is shown in the AERMOD output files shown in ***Attachment B*** at the end of the report. Based on actual receptor emission estimates shown in the AERMOD output files, we find that the annual concentration from the truck operations will produce 0.0009 $\mu g/m^3$ PM_{10} exhaust emissions at the highest receptor location (Receptor 3). Based on review of the AERMOD output files, the sensitive residential receptors would be exposed to between 0.0003 and 0.0009 $\mu g/m^3$ of diesel particulates from the project during operations.

Figure 4-A: PM10–Truck Operations Idling/Movement AERMOD Plot

Based on the analysis, the inhalation cancer risk for a 70-year duration is between 0.241 and 0.755 per one million exposed at receptors shown. Calculations for these risks are shown in ***Attachment C*** to this report. Based on this, the cancer risk from operations would be less than significant. In addition, it should be noted that the non-cancer health risks could be exposed if DPM -case DPM emissions exceed 5 µg/m^3. Since the Project would only produce 0.0009 µg/m^3 at the nearest sensitive receptors, chronic non-cancer risks wouldn't be expected. Therefore, a less than significant non-cancer risk is expected.

4.4 Cumulative Impact Findings

Cumulative impacts would exist when either there are direct air quality impacts or when multiple construction projects occur within the same area simultaneously. To illustrate this, if a project was to produce air quality emissions simultaneous to a nearby construction project the addition of both project emissions to the environment could exceed significance thresholds. For this project, the construction emissions were found to be less than significant as shown in Table 4.1 above. If a nearby project was to be under construction at the same time, that project would need to simultaneously generate emissions such that the combined emissions offsite would increase and then ultimately exceed thresholds. Based on review of the Project site and a list of cumulative projects in the area (provided as ***Attachment D*** to this report), a scenario where significant cumulative air quality impacts could be generated is not expected. Therefore, a less than significant cumulative impact would be expected.

The project is located on two separate parcels having assessor's Parcel Numbers (APN) 1017-241-28 (zoned Public Open Space) and 1030-341-68 (zoned Institutional/Public Facility). The Project proposes to change the portion of the designated Public Open Space to Institutional/Public Facility which is required for the City's fire station. Lot 1030-341-68 is roughly 1.5 acres in size and since this area is zoned Institutional/Public Facility it would have an allowable Floor Area Ratio of 0.5 to 1 or ½ square foot per square foot. Given this, the project site could construct a 32,670 SF building on this single Lot and would remain consistent with the General Plan. Land uses allowed on this 1.5 acre site could consist of churches or even a hospital within this parcel alone. These uses generate considerably higher traffic intensity and in the case of a hospital consume more energy per square foot than a fire station which was estimated at 87 ADT within the Project traffic study.

The Project as designed would be constructed on a portion of Public Open Space and if the proposed Project was developed on this open space Lot alone, the land use intensity would be higher than what was assumed in the General Plan which could introduce significant cumulative operational air quality impacts in the City. However, since the Project would limit construction on both lots to 18,745 SF and since the allowable FAR for Lot 1030-341-689 alone is 32,670 SF, the project as designed would have a lower intensity after encumbering

both lots to the 18,745 SF limit as the Project proposes. Given this, since the Project would have a less than significant direct and cumulative air quality impact, the Project would not conflict with SCQAMD's ability to implement the 2022 AQMP.

4.5 Odor Impact Findings

Odor impacts from construction operations would be considered short term events and would not be considered an impact. Long term operations will not create offensive odors and would not create any operational odor impacts.

4.6 Conclusion of Findings

During construction of the proposed Project, fugitive dust emissions would be expected but would not exceed thresholds established by the SCAQMD. Given this, a less than significant construction impact would be expected. As a design feature, the project would require that all construction equipment is Tier 4 or equivalent which is the highest rated equipment as it relates to diesel particulate and NOx emission reductions. Given this, health risks related to DPM from construction equipment would not be expected.

Air quality emissions generated once the Project is operational in 2025 would be expected, however were shown to be less than significant. In addition, health risks impacts from diesel particulate matter generated from fire trucks and equivalent sources were also shown to be less than significant.

Finally, since the proposed project would have a fairly low FAR and generate only 87 ADT the Project intensity was shown to be less than what would be allowed on APN 1030-341-68. This finding would also be true even though the Project also would require some of APN 1017-241-28, which is zoned Public Open Space. Since the intensity of the Project is less than allowed under the City's General Plan, and since Air Quality and Health Risks are less than significant, the project as a whole would be consistent with both the RAQS and SIP.

As identified in this report, the project will implement Project Design Features which have an effect on reducing air quality emissions. These features were assumed within this analysis and modeled results assume the features are implemented. Based on this, the following design features will be a condition for approval by the City of Chino Hills.

1. In accordance with SCAQMDs Rule 403. All soil will be wet at least three times daily during earthwork activities.
2. The Project shall utilize Tier 4 diesel construction equipment during construction of the Project.

- - - - - -

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses RURAL Dispersion Only.

 **Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.

 **Other Options Specified:
        ADJ_U*   - Use ADJ_U* option for SBL in AERMET
        CCVR_Sub - Meteorological data includes CCVR substitutions
        TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  PM10

 **Model Calculates ANNUAL Averages Only
```

```
 **This Run Includes:    196 Source(s);       1 Source Group(s); and     447 Receptor(s)

               with:      7 POINT(s), including
                          0 POINTCAP(s) and      0 POINTHOR(s)
                and:    189 VOLUME source(s)
                and:      0 AREA type source(s)
                and:      0 LINE source(s)
                and:      0 RLINE/RLINEXT source(s)
                and:      0 OPENPIT source(s)
                and:      0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
         Model Outputs Tables of ANNUAL Averages by Receptor
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     0.00 ;  Decay Coef. =    0.000     ;  Rot. Angle
=     0.0
                  Emission Units = GRAMS/SEC                             ;  Emission Rate Unit Factor =
0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.9 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out
