## 1. Purpose

This Hydrology Report has been prepared in order to obtain entitlement approval of Tract 37857. Adkan Engineers has prepared this study to ensure that adequate size and proper operation of drainage facilities are incorporated into the Post-Development project site.

## 2. Project Description

The proposed project is located north of 45<sup>th</sup> street between Opal Street and Pacific Avenue in the City of Jurupa Valley. The site will have 36 lots for residential development, recreational lot and associated improvements. Offsite area from the west will drain to the site. On and offsite runoff will be treated with a Bio-retention Basins located at the southeast corner of the site.

### A. Vicinity Map

## 3. Pre-Development Hydrology

Site is vacant with no existing structures or roads on the site. All flows from the site flow towards the east and south east towards Pacific Avenue to the Sunnyslope Channel.

## 4. Post-Development Hydrology

Onsite low flow runoff from the proposed development will flow into a onsite stormwater treatment area (Bio-retention basin) located at the south east corner of the site along 45<sup>th</sup> Street. The bioretention basin is sized for water quality and drain to the approved flood control channel near Pacific Avenue and 45<sup>th</sup> Street.

## 5. Method of Analysis

The site hydrology was based upon Riverside County Flood Control and Water Conservation District Hydrology Manual, from which pertinent soil and rainfall information was obtained.

Storm flows were determined by the “RATIONAL METHOD HYDROLOGY COMPUTER PROGRAM”, Riverside County Flood Control & Water Conservation District 1978 Hydrology Manual, produced by Bondamin Engineering.

The site was also analyzed by the “SYNTHETIC UNIT HYDROLOGY METHOD COMPUTER PROGRAM”, Riverside County Flood Control & Water Conservation District 1978 Hydrology Manual, produced by Bondamin Engineering.

## 6. Summary of Findings

Offsite and onsite flows surrounding the site will be collected by the Sunnyslope Channel east of Pacific Avenue and will be adequately sized to convey the 100-year storm event. All onsite flows will be treated using the proposed bio-retention basin prior to leaving the site. The bioretention basin will have a primary outflow structure for the proposed Q100 and secondary outlet structure for emergency outflow in the event the primary out flow structure fails.

The Extended Basin will have a primary outlet with an grated inlet elevation of 841 and a weir length of 16 linear feet. The Q100 water surface elevation will rise to a potential 841.41. An spillway has been placed in the event of failure at 841.45 and will have a ponded Q100 elevation of 841.72, **providing over 2’ of freeboard to the nearest pad elevation from the ponding emergency overflow elevation.** The top of basin is at an elevation of 842, so in the event that the emergency overflow would fail, stormwater could overtop the basin and follow the existing flow path to the Northeast.

The proposed extended detention basin has been sized to store the entire 2 year 24 hour storm event. A low flow pump will be placed within the basin to drain the low The A low flow pump will be provided within the basin to empty the remaining 2 year storm event within 72 hours. The remaining 100 year event will pass through the basin and outlet through and under sidewalk drain to the curb on 45th street.

### 7. Conclusion

The hydrologic calculations provided herein substantiate the design of the Post-Development project and indicate the following:

- The Post-Development facilities demonstrate the ability to convey the 100 year storm events.

Based on the Hydrology and Hydraulic analysis conducted and results shown herein and part thereof, it is our conclusion this project **does not** negatively impact the local community or watershed goals.

Notes:

1. Land use should be based on ultimate development of the watershed. Long range master plans for the County and incorporated cities should be reviewed to insure reasonable land use assumptions.
2. Recommended values are based on average conditions which may not apply to a particular study area. The percentage impervious may vary greatly even on comparable sized lots due to differences in dwelling size, improvements, etc. Landscape practices should also be considered as it is common in some areas to use ornamental gravels underlain by impervious plastic materials in place of lawns and shrubs. A field investigation of a study area should always be made, and a review of aerial photos, where available may assist in estimating the percentage of impervious cover in developed areas.
3. For typical horse ranch subdivisions increase impervious area 5 percent over the values recommended in the table above.
