[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations tables in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations tables should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was California State Plane Zone II (FIPSZONE 402). The **horizontal datum** was NAD 83, GRS80 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

NGS Information Services
NOAA, N/NGS12
National Geodetic Survey
SSMC-3, #9202
1315 East-West Highway
Silver Spring, Maryland 20910-3282
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit its website at http://www.ngs.noaa.gov.

Base map information on this FIRM was derived from multiple sources. Data was provided in digital format by the County of Sonoma Information Systems Department, derived from 1:1,200, 1:2,400, and 1:4,800 scale digital orthophotos, dated April-May 2000. Information was provided by the City of Healdsburg Department of Public Works, derived from 1:600 scale digital orthophotos, dated March 3, 2007. Additional information was derived from 1:12,000 scale U.S. Geological Survey Digital Orthophoto Quadrangles, dated 2002.

This map reflects more detailed and up-to-date **stream channel configurations** than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study Report (which contains authoritative hydraulic data) may reflect stream channel distances that differ from what is shown on this map.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

Contact the **FEMA Map Service Center** at 1-800-358-9616 for information on available products associated with this FIRM. Available products may include previously issued Letters of Map Change, a Flood Insurance Study report, and/or digital versions of this map. The FEMA Map Service Center may also be reached by Fax at 1-800-358-9620 and its website at http://msc.fema.gov.

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov.

LEGEND

SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99	Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

- 1% annual chance floodplain boundary
- 0.2% annual chance floodplain boundary
- Floodway boundary
- Zone D boundary
- CBRS and OPA boundary
- Boundary dividing Special Flood Hazard Area Zones and boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or flood velocities.
- 513 — Base Flood Elevation line and value; elevation in feet*
- (EL 987) — Base Flood Elevation value where uniform within zone; elevation in feet*

* Referenced to the North American Vertical Datum of 1988

- A — A — Cross section line
- 23 — — — 23 — Transect line
- 87°07'45", 32°22'30" — Geographic coordinates referenced to the North American Datum of 1983 (NAD 83), Western Hemisphere
- 2°76°000'N — 1000-meter Universal Transverse Mercator grid values, zone 10
- 600000 FT — 5000-foot grid ticks: California State Plane coordinate system, zone II (FIPSZONE 0402), Lambert Conformal Conic projection

III. DISCUSSION & CONCLUSION

III. DISCUSSION

Introduction

The purpose of the attached analysis is to determine the existing and proposed storm water discharge flow for the project. The project is located on a vacant lot in the City of Cotati, CA. The project is bound by Gravenstein Highway to the south, Alder Avenue to the west, residential properties to the north and vacant lots to the east.

This hydrology report will calculate the 10-year and 100-year storm water runoff for this location. The hydraulics will be calculated for the last reach of storm drain pipe at this time.

Existing Conditions

The existing 7.53 acres site is 99% pervious and is currently a vacant lot consisting of miscellaneous trees and shrubs with one driveway approach. The site is relatively flat and drains to the north west. A relatively rectangular park located in the North east corner of the site will remain unchanged and is noted as Area X2 in this report.

Runoff is collected in a couple of drop inlets where it is conveyed to the private drainage swale located along the northerly boundary of the adjacent tract “Cotati Cottages.” The proposed project site holds an easement for rights to drain to this private drainage swale.

The storm drain system located within Alder Ave starts upstream near the intersection of Gravenstein Hwy. A 30” RCP runs north-easterly where it transitions to a 36” RCP. Further downstream, the storm drain system transitions to 52” RCP where a 24” RCP connection from the private drainage swale merges from the east.

Project Description

The project proposes the construction of 3 multifamily buildings and 3 residential/ retail buildings with 4 access points. Associated improvements will include a clubhouse with pool and gym, hardscape and landscape, bioretention swales, along with modifications to the private drainage swale.
The project proposes a storm drain system that will convey storm water offsite and will connect to the City storm drain system. The hydrology report demonstrates emergency ponding elevations in the event the storm drain system fails. It can be seen that there is well over 1’ of protection between the overflow elevation and finished floor of all living spaces.

A previously reviewed and approved improvement plan for this subject parcel detailed a similar proposed storm drain system connecting to and modifying the existing drainage swale. See documents attached to this report.

Hydrology and Calculation Methodology

The hydrology study was performed utilizing Sonoma County Water Agency Flood Design Manual and City of Cotati Standards.

The hydraulics of the last reach of storm drain pipe calculated as follows.

Conclusion

The results from this hydrology and hydraulic analysis demonstrate the following:

- Per FEMA FIRM Map Number 06097C0878E Panel 878 of 1150, revised December 2, 2008, the subject site is in Zone X described as areas of 0.2% annual chance flood; areas of 1% foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood. There is no established Base Flood Elevation (BFE) for this area. Proposed building finished floors (FF) will be set at least 1 foot higher than the closest safe outlet elevation. The overflow elevation is noted on the hydrology maps attached.
- The project Q10 and Q100 flows will increase for the developed portion of the site from existing to proposed as shown in the table below and in the hydrology maps attached.
- The detention basin/ swale will be modified to accommodate the additional flows including bioretention and storage.
- The 2002 Storm Drain Master Plan identifies the storm drain system in Alder Ave, and this project is within that subwatershed. The Master Plan does not identify the private drainage swale.
- The storm drain pipe is sized to handle the anticipated 100-yr flows.

A table of pre- and post-development flows can be seen in the table below:

Condition	Area	10-YR Flow (cfs)	100-YR Flow (cfs)
Pre-Developed Condition X1	6.74	2.84	4.27
Post-Developed Condition D1	6.74	5.37	8.10
Percent Change		+89.08%	+89.7%
Undisturbed Area X2	0.79	0.3	0.45

VI. AS-BUILTS AND REFERENCE DOCUMENTS

Existing Drainage Facilities

The project drains to an existing swale, inlet structure and 24” storm drain pipe north of the site.
The developed 100 year flow from the existing site to the north has been calculated per the project’s hydrology report to by 7.13 cfs. Excerpts from the approved report are attached herein.
The developed 100 year flow for the proposed site is 8.10 cfs.
The maximum flow into the swale, inlet, and 24” storm drain pipe is 15.23 cfs.
The attached capacity calculations demonstrate that the swale has a capacity of 28.55 cfs while maintaining a 1’ freeboard, the 24” inlet has the capacity for 15.23 cfs while maintaining over 3’ of freeboard, and the existing 24” storm drain pipe has a capacity of 34.65 cfs.
This demonstrates that the existing facilities have the adequate capacity to convey stormwater from the existing site.

Excerpts from approved Hydrology Report for Existing Site
