6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	11.8	annual days of extreme heat
Extreme Precipitation	4.05	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	10.7	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

-------------------------	---	---	---	-----

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

Palo Alto Fiber Optic Project AQGHG General Assumptions

CalEEMod Inputs that are not modeling defaults:

Project Location	County	Title: Palo Alto Fiber Optic Project
	Santa Clara	Date: 3/28/2024
Climate Zone	7	
Urbanization	Suburban	
Operational Year (Buildout)	2030	
Construction Start	Jan-24	
Utility Company	City of Palo Alto	

Land Use	Subtype	Unit	size (SF)	size (miles)	Acres
Linear	Roadway Construction	SF	4,752,045	89.990	109.09
Parking	Non Asphalt	SF	573		0.01

Data Request/PD	Size	Unit	Feet	Disturbance Area (sf)	
Trenching	89.99 Miles		475,147	4,751,472	*assumes disturbance area width of 10 ft
Overhead	104.48 Miles		551,654	N/A	
Utility Cabinets	147 Qty		4	573	

Modeling Notes:

Land Use Characteristics: The 89.99 miles of below ground fiber was all assumed to be laid via open-trench and modeled as "Roadway Construction" subtype. The 104.48 miles of aerial installation were excluded from the land use inputs as single bucket trucks are captured in the default equipment list.

Utility Cabinets, underground vaults, and Pre-fab shed: Calculated total footprint of utility cabinets and modeled as "Parking-Non asphalt". Pre-fab shed and underground vaults were not included in land use inputs. Pre-fab shed would require a single truck/crane (captured in default equipment list). Underground vault excavation is captured by trenching activity.

Material Movement: It is likely that the majority of excavated material would be backfilled onsite. However, this analysis conservatively assumes one haul truck round trip per day.

Construction Schedule: Assumes six full years of construction beginning in January 2024. Default phase lengths and sequence retained in the absence of project-specific info.

Construction Equipment: Model utilizes CalEEMod defaults rather than the "typical equipment" provided due to unknown equipment quantities. This represents a conservative assumption as CalEEMod-generated equipment scenario would be more intensive. Two user edits on this page: (1) CalEEMod defaulted to 97 signal boards in every phase; revised to 5 signal boards per phase. (2) Added bore/drill rig to grading/excavation phase.
