I. INTRODUCTION

Luna 395 Commercial is a siteplan of approximately 3.57 acres with 4 proposed buildings, located at the southwest corner of Luna Steet and Hwy 395 in the City of Victorville. The property is rectangular in shape and is bordered by the paved roads to the West, South, and East. This is a “priority project” as it is greater than 10,000 sf of impervious area, and thus a WQMP is required.

The purpose of this study is to determine the 100-year storm runoff emanating from on-site and off-site areas for the Luna 395 Commercial Project, and to show how the site plan handles storm water. The study will determine the peak flow rate for the existing condition, the peak flow rate for the proposed condition, proposed condition flow rate routed through two combination water quality and detention basins, and one underground storage system. Additional analysis will confirm hydraulic capacity of collection systems.

The scope of the study includes the following:

- Determination of points of flow concentration and watershed areas.
- Determination of the 100-year 24 hours storm runoff based upon the onsite drainage conditions utilizing the San Bernardino County Flood Control District (SBCFCD) SCS Unit Hydrograph Method.

II. SITE DISCUSSION

The current property is vacant, undeveloped land with uniform slope of roughly 1.7% to the east. The topography indicates that the runoff drains in an easterly direction primarily in the form of sheet flow. There is existing development surrounding the site. Along the east side of the site is the Line E-01 regional system. The sites flows concentrate along the east side of the project where they intersect the Line E-01 regional flow path.

III. RAINFALL DATA

The San Bernardino County Flood Control District (SBCFCD) hydrology Manual, (Reference 1) was used to develop the hydrological parameters for the 10-year and 100-year storm events. The Rational Method was used to determine the peak flow rates associated with the existing project conditions as well as the time of concentration used in the Unit Hydrograph method. In addition, the Unit Hydrograph Method was utilized to determine the runoff volume. Computations were performed using the CivilCADD drainage software for San Bernardino County Developed by CivilDesign Corporation.

Rainfall data was taken from the isohyetal maps from the SBCFCD hydrology Manual.

Return Period - Duration	Isohyetal (in)
10 year - 1 hour	0.69
2 year - 6 hour	0.89
2 year - 24 hour	1.64
100 year - 1 hour	1.15
100 year - 6 hour	2.51
100 year - 24 hour	5.41

Hydrologic Soil Group “A” and an Antecedent Moisture Conditions (AMC) 2 (10yr) and 3 (100yr) are used for the study area. The percentage impervious

is 90, and the SCS runoff is 46 and 32. Refer to Appendix B for additional detail.

The projects runoff is designed to be contained in two basins and one underground system that will act as both water quality infiltration, and flood storage for peak runoff mitigation. The 100- year 24 runoff event is the limiting factor for design.

IV. ONSITE RUNOFF

Existing Condition/Pre Development

The runoff from the subject site in the existing condition is primarily sheet flow draining easterly to the roughly the northeast corner of the site. It is shown as Area A and Nodes 101 to 102 on the Existing Conditions Drainage Exhibit in Appendix A. The peak flow rate is 6.4 cfs and the time of concentration is 19.6 minutes.

Proposed Condition/Post Development

The proposed condition is to utilize three small basins for water quality and flood routing and another underground system for stormwater treatment and detention for the site. The Rational method was prepared for determination of time of concentration for use in the development of the Unit Hydrographs. The post development 100 year runoff for area A1 is 1.9 cfs and 7.2 min. The post development 100 year runoff for area B1 is 1.9 cfs and 7.5 min. The post development 100 year runoff for area C1 is 2.8 cfs and 7.4 min. The post development 100 year runoff for area D1 is 9.5 cfs and 7.0 min.

The post development runoff is routed through the proposed basins to confirm post development runoff could be mitigated to less than pre-development runoff. The four systems are designed to be dual purpose retention and detention with the roughly bottom one half (0.5) to one (1) foot of depth supplying the required water quality retention and infiltration of the WQMP design storms. After routing through the proposed basin the post development 100 year 24 hour runoff for area A1 is 1.22 cfs at a depth of 0.92', for Area B1 is 0.94 cfs at a depth of 1.4', for Area C1 is 1.68 cfs at a depth of 2.20', and for Area D1 is 2.80 cfs at a depth of 7.9'. The total post development runoff is 5.7 cfs, or 90% of predevelopment peak runoff. Refer to Appendix B for detailed output files.

The primary hydraulic design elements are the roads, curb openings, storm drain, and the outlets from the basins. Drive lanes within the project will be used to carry runoff. At time of final design details for individual collection systems will be confirmed. Storm drain will be used to accept

and route offsite flows from the south, per the Line E-01 Plans. Refer to the Proposed Conditions Drainage Exhibit, Appendices B and C additional detail.

V. OFFSITE RUNOFF

The offsite contributing areas to the subject site are from the South. Line E-01 will be carried northerly through an earthen channel. For preliminary design it is assumed the culvert crossing of the southern access point will match the culvert sizing of the system under Luna. At time of final design additional details will be provided.

VI. STORMWATER TREATMENT

Stormwater treatment will be provided by the bottom of the proposed basins, where the required volume will infiltrate into the groundwater. The basins exceed the required water quality volume. Water quality calculations were prepared based on the San Bernardino County Model Water Quality Management Plan Guidance document. The following calculations were used in sizing of facilities;

- WQ Contributing area
 - o Area A1 - 0.43 acres
 - o Area B1 - 0.44 acres
 - o Area C1 - 0.64 acres
 - o Area D1 - 2.10 acres
- 2 yr 1 hour rainfall - 0.40"
- Impervious ratio - 90% (from SBCFCD hydrology Manual)
- $C_{BMP} = 0.73$
- Drainage Area Region - Desert - Regression Coefficient $P_6 = 1.2371$
- $P_6 = 1.2371 \times 0.40" = 0.49"$
- Regression Constant $a = 1.963$ for 48 hours
- $P_0 = a * C_{BMP} * P_6 = 1.963 \times 0.73 \times 0.49 = 0.702$
- $V_0 = (P_0 * A)/12$
 - o $V_{A1} = (0.702 \times 0.43)/12 = 0.025$ acft
 - o $V_{B1} = (0.702 \times 0.44)/12 = 0.026$ acft
 - o $V_{C1} = (0.702 \times 0.64)/12 = 0.037$ acft
 - o $V_{D1} = (0.702 \times 2.10)/12 = 0.123$ acft

VII. CONCLUSION

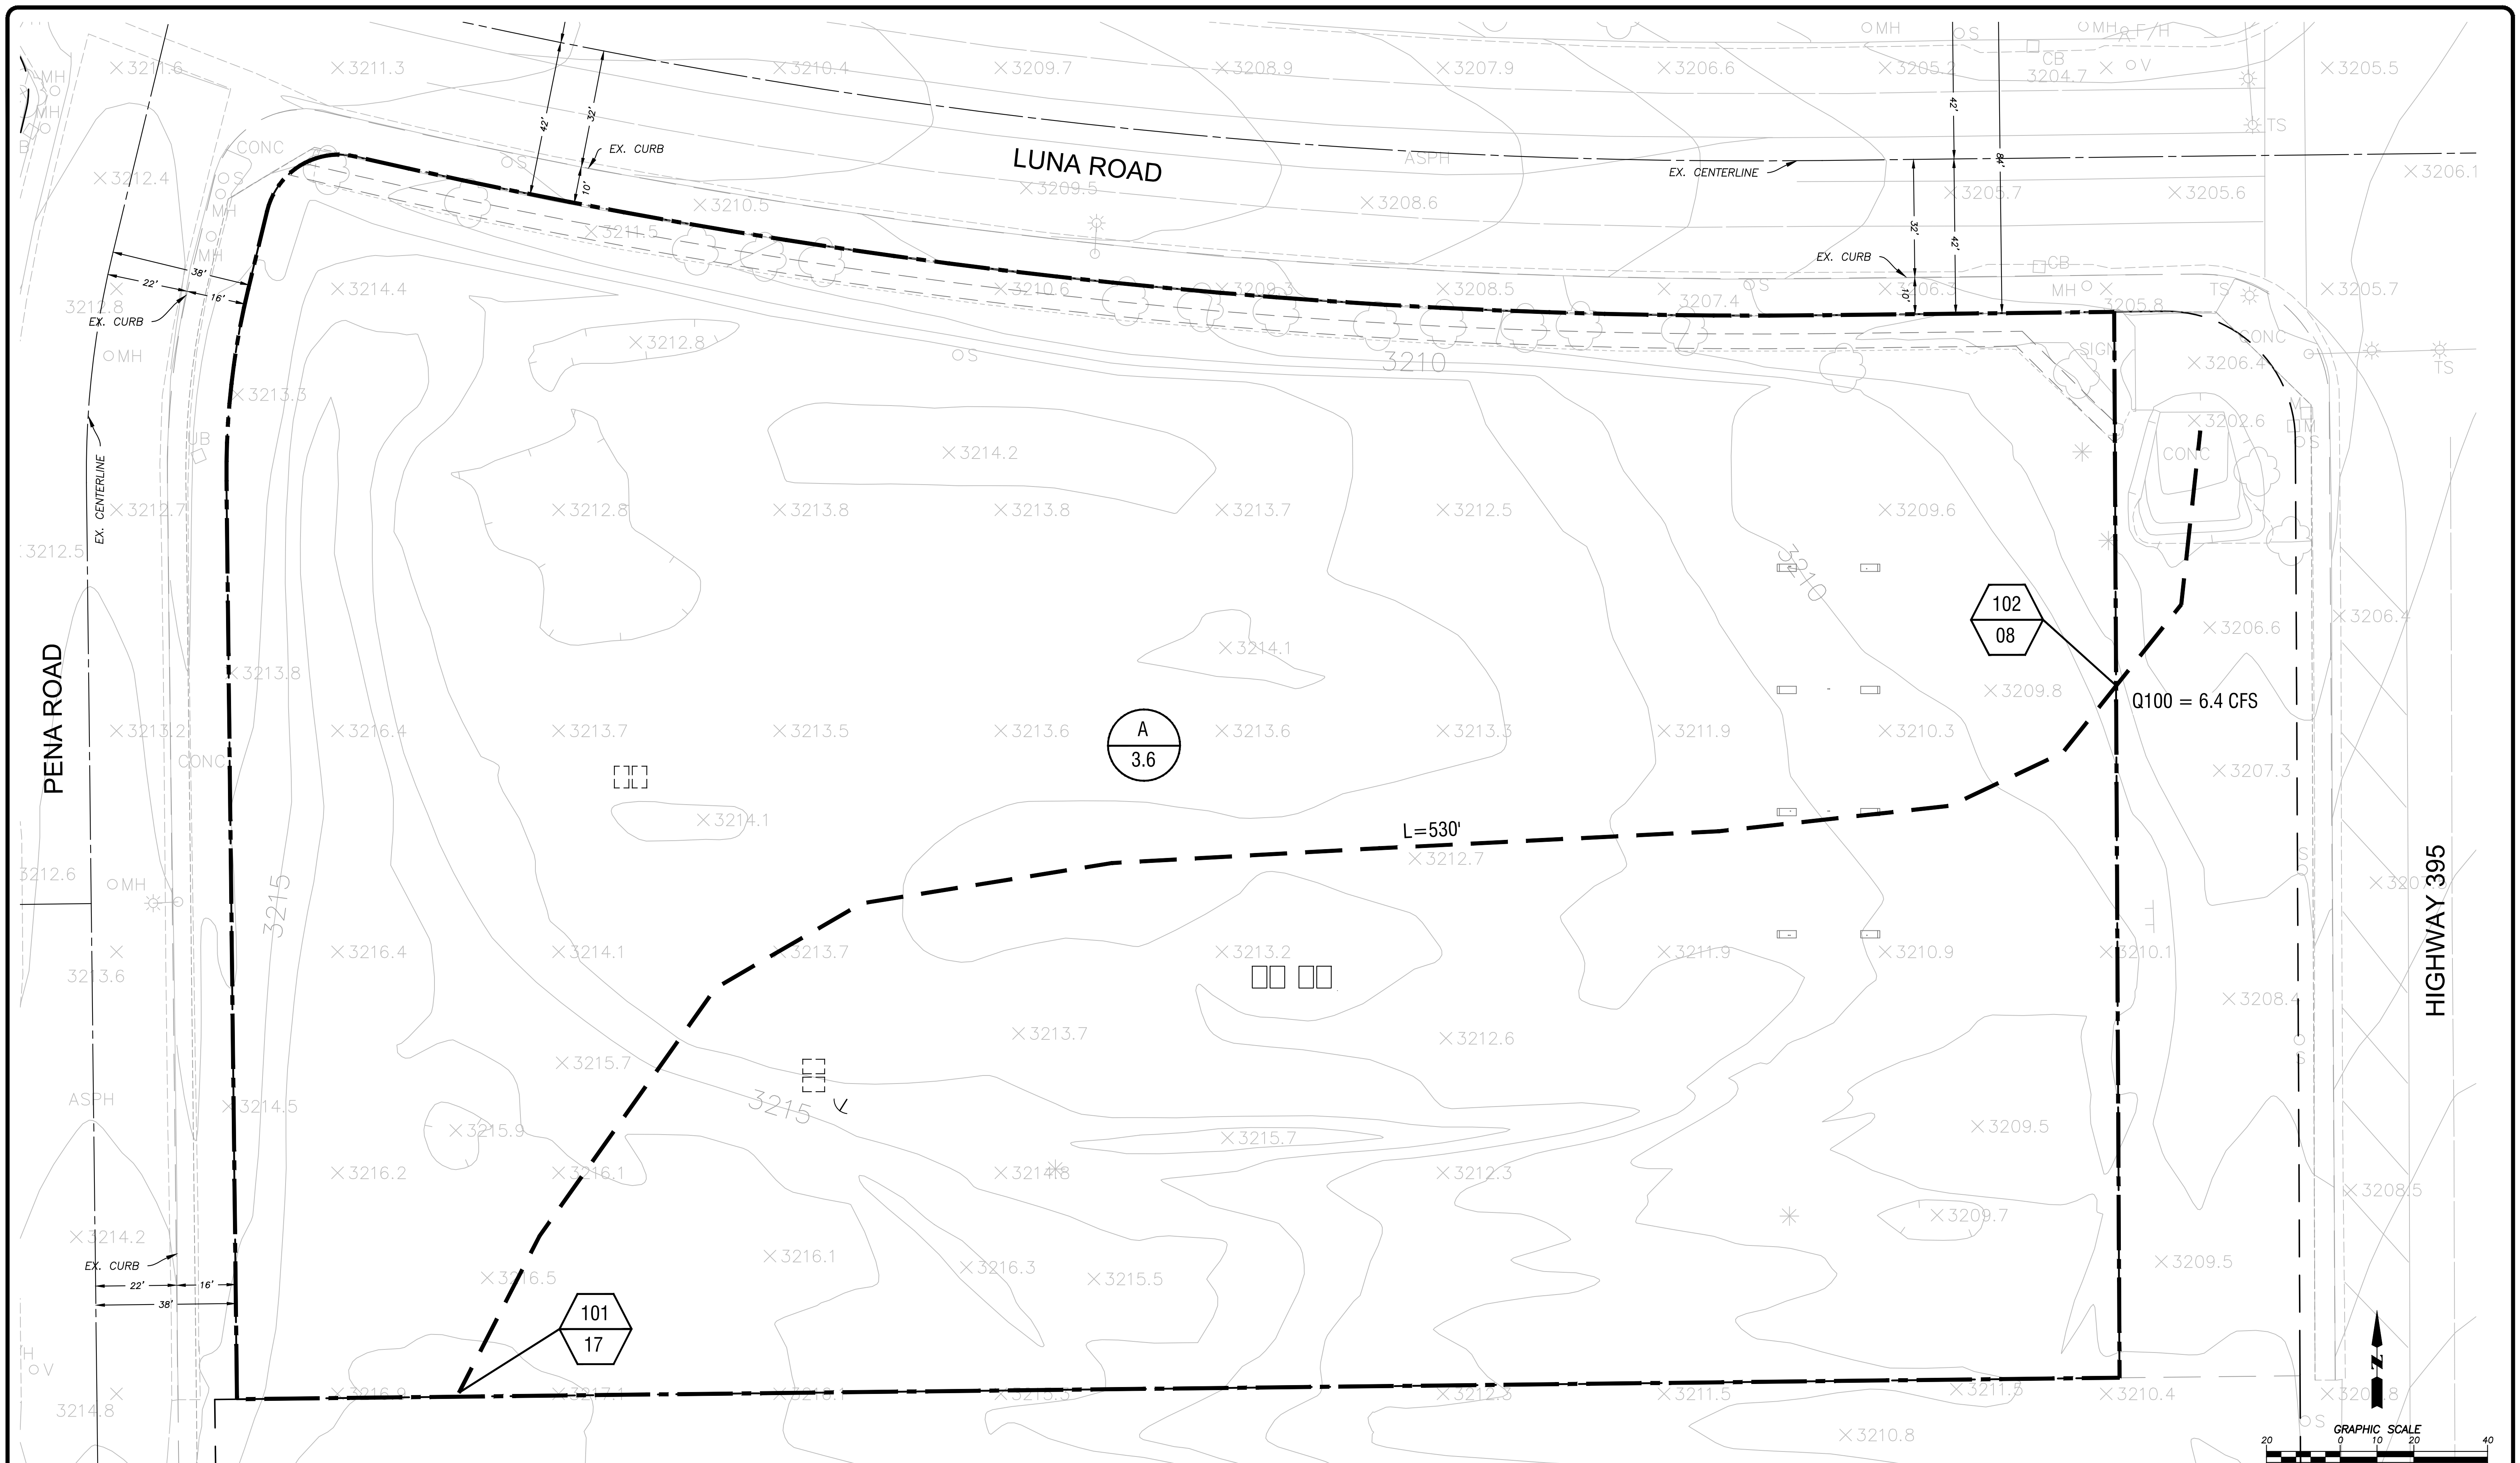

The proposed development of the Luna 395 Commercial Project, a 3.57 acre, 4 building site plan can be mitigated as designed and analyzed in this report to be compatible with the City of Victorville Master Plan of Drainage. The development of the subject site will not change area drainage patterns,

impact any of the surrounding properties, or change any of the regional master plan facilities. The Site will construct combination retention and detention basins and an underground storage system of sufficient size to handle water quality through infiltration, and flood mitigation through detention. The drive aisles will be analyzed and confirmed to contain the 10 year and 100 year runoff remains within the curbs. The basins and outlet structures have been designed and analyzed in conjunction with preliminary grading design and street grades to confirm capacity to adequately handle the design storm runoff.

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS). Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values. Please refer to NOAA Atlas 14 document for more information.

Notes:

1. Land use should be based on ultimate development of the watershed. Long range master plans for the County and incorporated cities should be reviewed to insure reasonable land use assumptions.
2. Recommended values are based on average conditions which may not apply to a particular study area. The percentage impervious may vary greatly even on comparable sized lots due to differences in dwelling size, improvements, etc. Landscape practices should also be considered as it is common in some areas to use ornamental gravels underlain by impervious plastic materials in place of lawns and shrubs. A field investigation of a study area shall always be made, and a review of aerial photos, where available, may assist in estimating the percentage of impervious cover in developed areas.
3. For typical equestrian subdivisions increase impervious area 5 percent over the values recommended in the table above.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: San Bernardino County, California, Mojave River Area
Survey Area Data: Version 13, Sep 13, 2021

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Mar 27, 2021—May 24, 2021

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Setting

National map unit symbol: hkrj

Elevation: 1,800 to 3,200 feet

Mean annual precipitation: 3 to 6 inches

Mean annual air temperature: 59 to 66 degrees F

Frost-free period: 180 to 290 days

Farmland classification: Farmland of statewide importance

Map Unit Composition

Cajon and similar soils: 85 percent

Minor components: 15 percent

Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Cajon

Setting

Landform: Alluvial fans

Landform position (two-dimensional): Backslope

Landform position (three-dimensional): Tread

Down-slope shape: Linear

Across-slope shape: Linear

Parent material: Alluvium derived from granite sources

Typical profile

H1 - 0 to 7 inches: sand

H2 - 7 to 25 inches: sand

H3 - 25 to 45 inches: gravelly sand

H4 - 45 to 60 inches: stratified sand to loamy fine sand

Properties and qualities

Slope: 0 to 2 percent

Depth to restrictive feature: More than 80 inches

Drainage class: Somewhat excessively drained

Capacity of the most limiting layer to transmit water (Ksat): High to very high (5.95 to 19.98 in/hr)

Depth to water table: More than 80 inches

Frequency of flooding: None

Frequency of ponding: None

Calcium carbonate, maximum content: 1 percent

Available water supply, 0 to 60 inches: Low (about 4.1 inches)

Interpretive groups

APPENDIX C: PROJECT HYDRAULIC CALCULATIONS

Weir Report

Basin A Outlet

Rectangular Weir

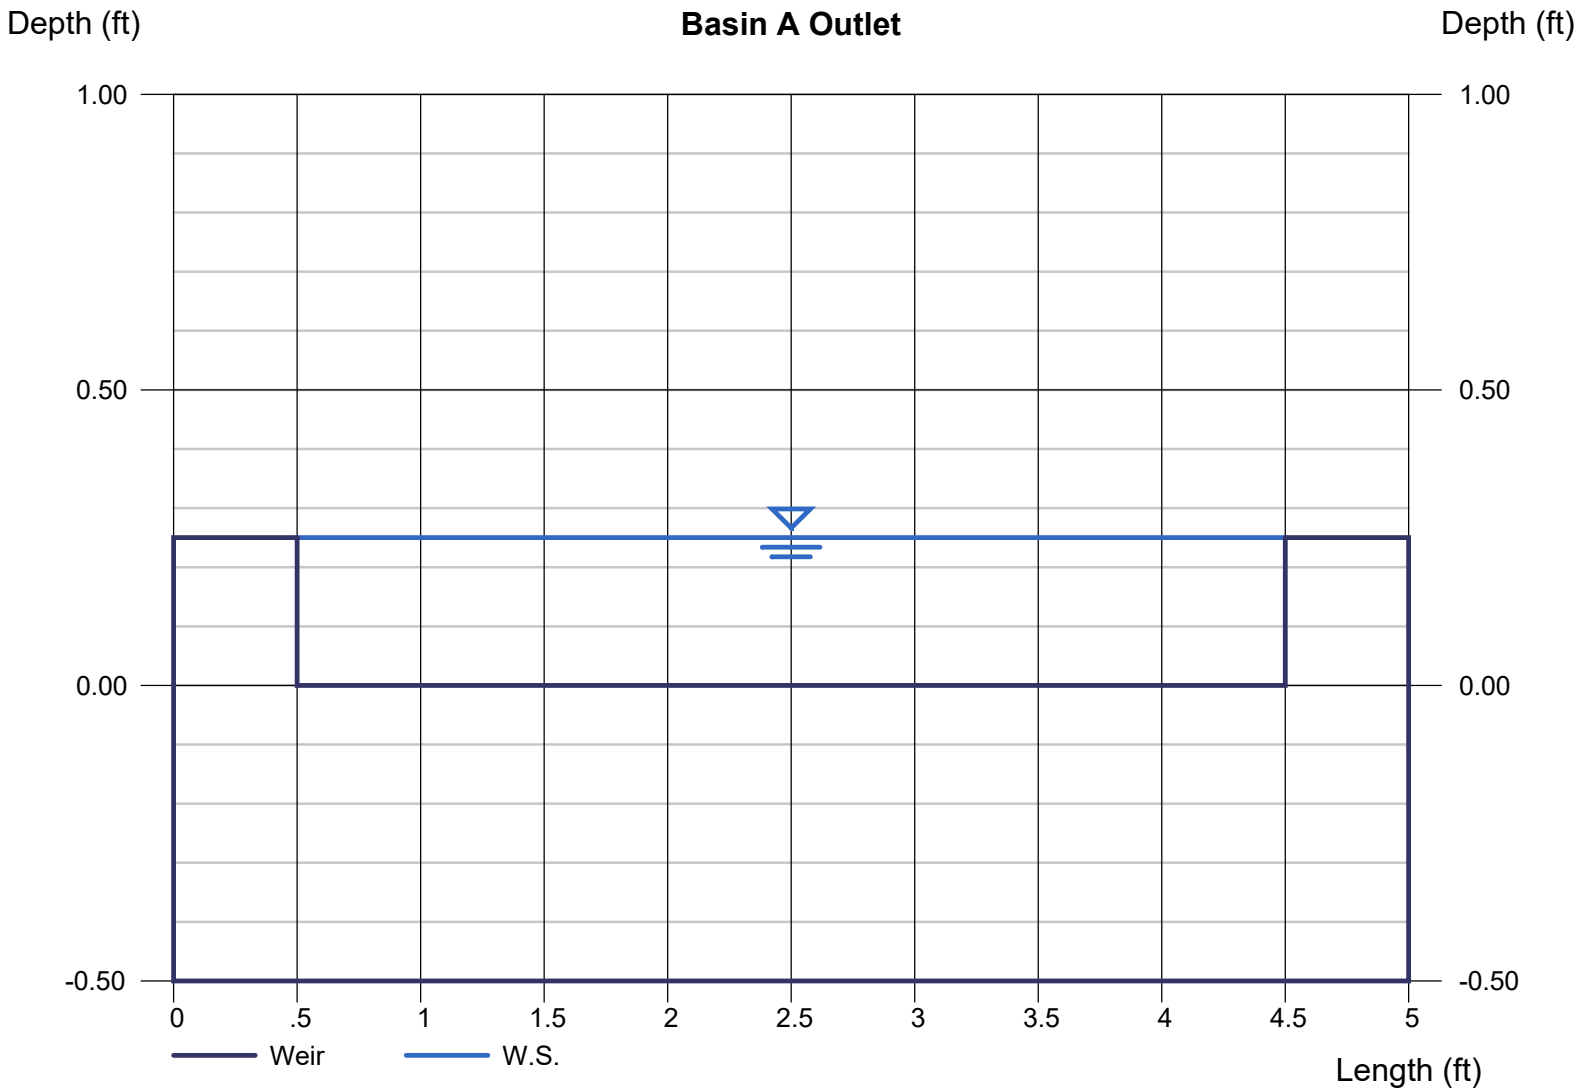

Crest = Sharp
Bottom Length (ft) = 4.00
Total Depth (ft) = 0.25

Highlighted

Depth (ft) = 0.25
Q (cfs) = 1.665
Area (sqft) = 1.00
Velocity (ft/s) = 1.67
Top Width (ft) = 4.00

Calculations

Weir Coeff. Cw = 3.33
Compute by: Q vs Depth
No. Increments = 10

Inlet Report

Basin C Revised Outlet Design

Drop Grate Inlet

Location	= Sag
Curb Length (ft)	= -0-
Throat Height (in)	= -0-
Grate Area (sqft)	= 0.66

Storage Volume Required (cf):	12,200
Limiting Width (ft):	23.00
Invert Depth Below Asphalt (ft):	
Solid or Perforated Pipe:	Perforated
Shape Or Diameter (in):	96
Number Of Headers:	1
Spacing between Barrels (ft):	3.00
Stone Width Around Perimeter of System (ft):	2
Depth A: Porous Stone Above Pipe (in):	6
Depth C: Porous Stone Below Pipe (in):	6
Stone Porosity (0 to 40%):	40

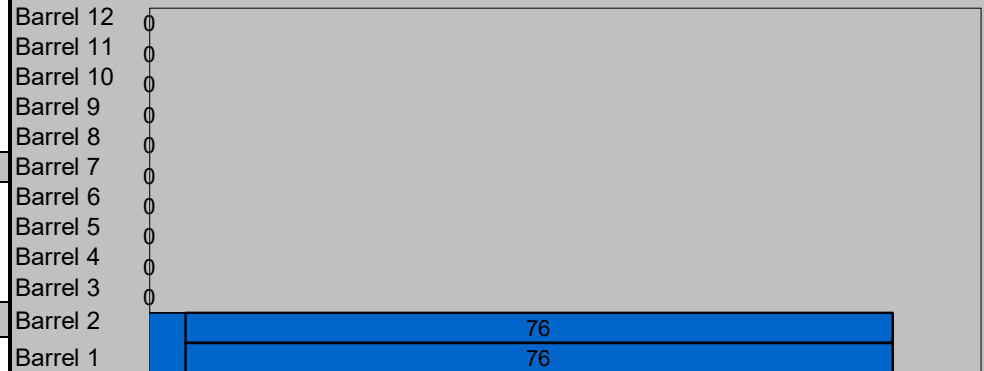

50.27 ft² Pipe Area

System Sizing

Pipe Storage:	8,595 cf	
Porous Stone Storage:	3,848 cf	
Total Storage Provided:	12,444 cf	102.0% Of Required Storage
Number of Barrels:	2 barrels	
Length per Barrel:	76.0 ft	
Length Per Header:	19.0 ft	
Rectangular Footprint (W x L):	23. ft x 88. ft	

System Layout

CONTECH Materials

Total CMP Footage:	171 ft
Approximate Total Pieces:	9 pcs
Approximate Coupling Bands:	8 bands
Approximate Truckloads:	5 trucks

Construction Quantities**

Total Excavation:	0 cy
Porous Stone Backfill For Storage:	356 cy stone
Backfill to Grade Excluding Stone:	-675 cy fill

**Construction quantities are approximate and should be verified upon final design
