EXECUTIVE SUMMARY

In an effort to reduce flood risk in the Sacramento Region, the U.S. Army Corps of Engineers (Corps), the Central Valley Flood Protection Board, and the Sacramento Area Flood Control Agency have partnered to complete the American River Common Features 2016 Project (Project). In July 2018, Congress granted the Corps construction funding to complete this urgent flood control project under the Bipartisan Budget Act of 2018.

Most of the Project's environmental effects were addressed in the Revised 2016 American River Common Features General Reevaluation Report (ARCF GRR), Final Environmental Impact Statement/Environmental Impact Report (EIS/EIR) (Corps, 2016). This report was prepared to support a supplemental National Environmental Policy Act (NEPA) and California Environmental Quality Act (CEQA) analysis by characterizing terrestrial wildlife species and the natural communities along the Lower American River (LAR) covering approximately 134.12 acres from approximately river mile (RM) 5.0 to RM 7.8. This reach is referred to as Subreach 2 and is one of four recently established subreaches along the LAR for the Project. It is important to note that Subreach 2 is within the area identified in the GRR as Reach A for both the American River North (ARN) and American River South (ARS) study basins. The survey area encompasses a large portion of Subreach 2; it includes three sites which have been identified as having an unacceptable risk of levee failure due to erosion. Erosion protection measures have been proposed for these sites to improve the levees. The survey area includes the three sites, their associated work areas, staging areas, access routes, and associated buffers. Two buffer areas were established for the survey: a 100-foot buffer where the survey area abuts residential and commercial neighborhoods, and a 500-foot buffer in parkway areas along the Lower American River where the potential for sensitive species to be present is higher.

Although the constructed levee system and surrounding infrastructure have modified most of the survey area's native vegetation types and habitats, remnant stands of native vegetation are present. Natural communities present in the survey area include riverine (open water), annual grassland, mixed oak woodland, upland scrub, riparian scrub, and riparian woodland. Several sensitive natural communities (present in the aforementioned communities) also occur within the survey area. The natural communities were cross referenced with the California Wildlife Habitat Relationships System, which describes predominant wildlife species observed in these communities. Non-native communities and disturbed/developed areas that do not correspond to natural communities are also present in the survey area. Although these areas generally provide fewer habitat opportunities for wildlife, they may still provide cover and forage for some species.

One California species of special concern, the western pond turtle, was observed during field surveys in the survey area. In addition, although it was not observed, the Federally listed threatened valley elderberry longhorn beetle was assumed present based on the occurrence of its host plant and exit holes indicating its presence. Several other sensitive species have high potential to occur in the survey area, including nesting migratory birds and raptors and protected bat species.

CHAPTER 1
Introduction

1.1 Background and Purpose

The U.S. Army Corps of Engineers (Corps), the Central Valley Flood Protection Board, and the Sacramento Area Flood Control Agency are partnering to complete the American River Common Features 2016 Project (Project) to reduce flood risk for the Sacramento region. This report was prepared to support a supplemental environmental analysis of planned levee improvements to address erosion within Subreach 2, one of the four subreaches of the leveed reach of the American River that have been established for the purposes of analysis for this Project. Although most of the Project's environmental effects were addressed in the 2016 *American River Common Features General Reevaluation Report, Final Environmental Impact Statement/Environmental Impact Report* (ARCF GRR EIS/EIR), a supplemental environmental analysis under the National Environmental Policy Act (NEPA) and California Environmental Quality Act (CEQA) is underway to address the environmental effects of changed circumstances and new information regarding the Project that were not covered in the ARCF GRR EIS/EIR.

Subreach 2 is located along the Lower American River (LAR) from river mile (RM) 5.2 to RM 7.8. This subreach is the most hydraulically constrained and thus was the first to undergo an analysis of potential erosion repairs. Within Subreach 2, three sites requiring levee modification were identified: Site 2-1, Site 2-2, and Site 2-3. Subreach 2 is within the area identified in the GRR as Reach A for both the American River North (ARN) and American River South (ARS) study basins.

The intent and scope of this report are to characterize biological resources present within the survey area, their associated work areas, staging areas, access routes, and associated buffers. Two buffer areas were established for the survey: a 100-foot buffer where the survey area abuts residential and commercial neighborhoods, and a 500-foot buffer in parkway areas along the Lower American River where the potential for sensitive species to be present is higher. The surveys focused on terrestrial wildlife and natural communities that could provide habitat for these species. The regulatory context for the Project is presented in **Appendix A**.

1.2 Property Location

The project area, American River Contract 1, also referred to as Subreach 2, is located in the LAR, Sacramento, and extends from RM 5.2 to 7.8, between Paradise Bend and the Howe Avenue boat launch (**Figure 1**). The LAR drains into the Sacramento River approximately five miles downstream of the survey area. Residential neighborhoods and the Campus Commons Golf

Course lie to the east; and California State University, Sacramento, and additional residential neighborhoods are south and west of the survey area (**Figure 2**).

The survey area includes three sites requiring levee modification, along with their associated staging areas and access roads, between RM 5.0 and RM 7.8 (Figure 2):

- *Site 2-1* encompasses 0.8 miles of the left (west) bank of the LAR between RM 5.2 and RM 6.6. At this site, a minimal-width (20-foot) bench separates the levee toe from the river. The site extends from Glen Hall Park, at Paradise Bend, to California State University, Sacramento's Desmond Hall student housing building, approximately 0.15 RM upstream otf the H Street Bridge.
- *Site 2-2* is located on the right (north) bank, extending from about 250 feet upstream of the Howe Avenue Bridge to about 900 feet downstream of the bridge, i.e., from RM 7.45 to RM 7.7.
- *Site 2-3* is located on the right (north/east) bank and extends from about RM 7.2 downstream to RM 5.9, located along the Campus Commons Golf Course, crosses the H Street Bridge and the Guy West Bridge, and its upstream end is approximately across from the E. A. Fairbairn Water Treatment Plant's intake facility.

CHAPTER 2
Methods

2.1 Survey Area

In this report, the term "survey area" refers to the area where direct, indirect, or cumulative effects on biological resources could occur as a result of the proposed levee work. This area includes the three levee modification sites and the associated staging areas and access roads. The footprint of proposed Project activities was generally the starting point for defining the biological survey area; however, in practical terms, biological resources have varied sensitivity to disturbance and many species need a somewhat larger survey area. The Project's survey area therefore includes the footprint of the proposed facilities, plus a buffer ranging from approximately 100 feet to 500 feet, depending on habitat quality and access (Figure 2).

2.2 Survey Methodology

2.2.1 Survey Dates and Survey Personnel

ESA wildlife biologist Christy Dawson and botanist Joseph Sanders conducted a reconnaissance-level wildlife survey and habitat assessment of the survey area on June 28, 2019. The survey was conducted to observe and characterize vegetation communities, previously mapped in 2018, to assess habitat quality, and to determine the potential for common and special-status wildlife species to occur.

In addition to this general survey, focused surveys for valley elderberry longhorn beetle (VELB) were conducted by ESA biologists Kelly Bayne and Laura Dodson and ESA botanist Joseph Sanders from August 22 to August 30, 2018. These surveys were performed in accordance with methods described in U.S. Fish and Wildlife Service (USFWS) publications for VELB (USFWS, 1999, 2017).

2.2.2 Natural Communities and Vegetation Surveys

Vegetation communities were surveyed in the survey area in August 2018 to map natural and sensitive communities to the alliance level as described in the *Manual of California Vegetation*. Protocol-level botanical surveys were also conducted for the survey area and reported separately from this report.

2.2.3 Wildlife Surveys

The wildlife surveys cataloged any common or special-status wildlife species observed in the survey area and determined the potential for the presence of suitable habitat for special-status

wildlife species. The wildlife surveys were performed by walking meandering transects over the entire survey area to identify features that support wildlife species. A record was kept of all wildlife species encountered. Special-status species were mapped and global positioning system coordinates were collected for each occurrence.

2.3 Review of Background Information

Before conducting reconnaissance-level vegetation and wildlife surveys, ESA reviewed publicly available and subscription-based data on biological resources. The field surveys provided partial confirmation of the accuracy of publicly available data. The following data sources assisted in this analysis:

- Topographic maps (Sacramento East and surrounding eight 7.5-minute quadrangles)
- Historic and current aerial imagery
- California Wildlife Habitat Relationships database
- The California Department of Fish and Wildlife (CDFW) California Natural Diversity Database (CNDDB)
- The California Native Plant Society online database
- A USFWS species list

In addition to the above resources, background information for the Project can be found in the ARCF GRR Final EIS/EIR (Corps, 2016), which was reviewed during preparation of this report.

CHAPTER 3
Environmental Setting

3.1 Natural Communities and Associated Wildlife Habitats

Natural communities are assemblages of plant species that occur together in the same area, and are defined by species composition and relative abundance. The natural communities described here are largely consistent with the CDFW natural communities, which comply with the National Vegetation Classification Standard. These communities were crosswalked from previously mapped alliances, in accordance with the membership rules described in the *Manual of California Vegetation* (Sawyer et al. 2009). A crosswalk table is presented in **Appendix A**.

Botanical taxonomy and nomenclature conform to *The Jepson Manual: Vascular Plants of California, second edition* (Baldwin et al., 2012), as revised by the Jepson eFlora (Jepson Flora Project, 2019). Common names of plant species are derived from the Jepson Manual or Calflora (2019). Plant communities generally correlate with wildlife habitat types; wildlife habitats were classified and evaluated using *A Guide to Wildlife Habitats of California* (Mayer and Laudenslayer, 1988).

Natural communities present in the survey area include riverine (open water), annual grassland, mixed oak woodland, upland scrub, riparian scrub, and riparian woodland, all of which support various life stages for a wide array of wildlife. Non-native communities, invasive plants, and disturbed/developed areas that do not correspond to natural communities also are present in the survey area. Although these areas generally provide fewer habitat opportunities for wildlife, they may still provide cover and forage. **Figures 3a** through **3c** identify the distribution of native and non-native communities in the survey area.

Appendix B, Tables B-1 and B-2, respectively, present lists of wildlife and plant species that were observed during focused and reconnaissance-level surveys.

3.1.1 California Annual Grassland

Grasslands can be found throughout the survey area, typically in upland areas, and consist mainly of non-native grasses and forbs.[1] Common grass species observed in this community include wild oat (*Avena barbata*), bromes (*Bromus diandrus, B. hordeaceus*), foxtail barley (*Hordeum murinum*), rattail sixweeks grass (*Festuca myuros*), Bermuda grass (*Cynodon dactylon*), and Pacific bentgrass (*Agrostis avenacea*). Pockets of native grasses such as beardless wild rye

[1] Annual grasslands were previously called "ruderal herbaceous" in the 2016 ARCF GRR EIS/EIR.

(*Elymus triticoides*) and purple needle grass (*Stipa pulchra*) occur sporadically throughout the grasslands in the survey area as well.

An assemblage of native and non-native forbs also occurs in these grasslands. Among the many common non-native forbs observed are hairy vetch (*Vicia villosa*), cutleaf geranium (*Geranium dissectum*), Italian thistle (*Carduus pycnocephalus*), yellow star thistle (*Centaurea solstitialis*), prickly lettuce (*Lactuca serriola*), poison hemlock (*Conium maculatum*), wild radish (*Raphanus sativus*), wild mustard (*Hirschfeldia incana*), rose clover (*Trifolium hirtum*), and white sweet clover (*Melilotus indicus*). Some common native forbs observed include Canada horseweed (*Erigeron canadensis*), telegraph weed (*Heterotheca grandiflora*), ragweed (*Ambrosia psilostachya*), elegant clarkia (*Clarkia unguiculata*), and turkey-mullein (*Croton setiger*).

The species composition and structure of grasslands in the survey area vary. Some areas are relatively homogeneous, dominated by one or two species such as yellow star thistle and Bermuda grass, and other areas are much more heterogeneous, with several species occurring. Also, although annual grasslands occur on levee slopes, most of these areas are mowed regularly and thus may provide fewer habitat opportunities for some wildlife species than unmowed grassland areas.

Wildlife Habitat Relationship with California Grassland

Annual grassland provides little cover for most wildlife, yet numerous species forage and several species breed in this habitat type. Grasslands attract bumblebees and other insects that rely on flowering grassland species. They also attract reptiles and amphibians, such as western fence lizard (*Sceloporus occidentalis*), common garter snake (*Thamnophis sirtalis*), and gopher snake (*Pituophis melanoleucus*); and birds, including California quail (*Callipepla californica*), western bluebird (*Sialia mexicana*), lesser goldfinch *(Carduelis psaltria*), and barn swallow (*Hirundo rustica*).

Common small mammals expected to occur in grasslands in the survey area include western harvest mouse (*Reithrodontomys megalotis*), deer mouse (*Mus musculus*), California vole (*Microtus californicus*), black-tailed jackrabbit (*Lepus californicus*), and Botta's pocket gopher (*Thomomys bottae*). Small rodents, reptiles, and invertebrates attract raptors (birds of prey) including red-tailed hawk (*Buteo jamaicensis*), red-shouldered hawk (*Accipiter striatus*), and American kestrel (*Falco sparverius*), and special-status birds such as white-tailed kite (*Elanus leucurus*), burrowing owl (*Athene cunicularia*), and Swainson's hawk (*Buteo swainsoni*).

Non-native grasslands are important foraging grounds for aerial and ground-foraging insect eaters such as *Myotis* bat species and pallid bats. Larger mammals such as black-tailed deer (*Odocoileus hemionus*) and coyote (*Canis latrans*) were observed regularly moving through grasslands in the survey area during the biological resources surveys conducted in 2018 and 2019.

3.1.2 Mixed Oak Woodland and Upland Scrub

Oak Woodland

Oak woodlands within the survey area are dominated by coast live oak (*Quercus agrifolia*), valley oak (*Q. lobata*), and interior live oak (*Q. wislizeni*); Northern California black walnut (*Juglans hindsii*) and California bay (*Umbellularia californica*) are less frequent contributors to the tree canopy.

Oak woodlands in the survey area support a variety of understory plant species and vegetative structures. When no shrub layer is present, an annual grassland is the dominant understory and includes the common species described above for the California annual grassland community description. When oak woodlands support understory shrubs, common native shrubs observed include California rose (*Rosa californica*), California blackberry (*Rubus ursinus*), blue elderberry (*Sambucus nigra* ssp. *caerulea*), and coyote brush (*Baccharis pilularis* ssp. *consanguinea*). Himalayan blackberry (*Rubus armeniacus*) was the only common non-native shrub observed in the understory of oak woodlands.

Oak woodland is considered a sensitive natural community by CDFW and includes Great Valley valley oak/oak riparian forest.

Upland Scrub

Upland scrub habitat in the survey area consists of areas dominated by native and non-native shrubs that have no tree cover and contain the common herbaceous species described above for California annual grassland. Common native shrub species observed are coyote brush, blue elderberry, California rose, California blackberry, California grape (*Vitis californica*), and western redbud (*Cercis occidentalis*).

Wildlife Habitat Relationships with Mixed Oak Woodland and Upland Scrub

Animals within oak woodland habitat in the survey area include those heavily reliant on acorns, such as the acorn disseminators western scrub jay (*Aphelocoma californica*), acorn woodpecker (*Melanerpes formicivorus*), and western gray squirrel (*Sciurus griseus*). Wild turkey (*Meleagris gallopavo*), California quail, and black-tailed deer use acorns as a major food source.

Deer also use the foliage of several hardwoods. Oak titmouse (*Baeolophus inornatus*), dark-eyed junco (*Junco hyemalis*), ash-throated flycatcher (*Myiarchus tuberculifer*), northern flicker (*Colaptes auratus*), lesser goldfinch (*Carduelis psaltria*), and great horned owl (*Bubo virginianus*) nest in woodland habitat. Cavity nesters include western bluebird, and ash-throated flycatcher. Special-status birds such as Cooper's hawk (*Accipiter cooperii*) and sharp-shinned hawk (*A. striatus*) are known to nest in these woodlands. The pallid bat, also a special-status species, may inhabit these woodlands as well.

Amphibians and reptiles can be found on the forest floor where moisture is retained under fallen wood and in tree crevices; among these species are California toad (*Anaxyrus boreas halophilus*)

and Sierran treefrog (*Pseudacris sierra*). Reptiles include western fence lizard, southern alligator lizard (*Elgaria multicarinata* ssp. *multicarinata*), ringneck snake (*Diadophis punctatus*), gopher snake, western rattlesnake (*Crotalus viridis helleri*), and California king snake (*Lampropeltis zonata*). Many of these species will also use adjacent upland scrub areas for foraging or cover.

3.1.3 Valley Foothill Riparian

Riparian Scrub

Riparian scrub habitat in the survey area consists of shrub-dominated areas that are subject to hydrologic influence from the LAR. These areas are dominated by sandbar willow (*Salix exigua*), arroyo willow (*S. lasiolepis*), common button bush (*Cephalanthus occidentalis*), California rose, California blackberry, California wild grape, blue elderberry, and Himalayan blackberry. Areas that experience high flows typically do not support herb species and cobbles tend to be the dominant ground cover. Areas that experience slower flows support a variety of herb species including mugwort (*Artemisia douglasiana*), marsh brittlegrass (*Setaria parviflora*), Santa Barbara sedge (*Carex barbarae*), horsetails (*Equisetum arvense* and *E. hymale* ssp. *affine*), rushes (*Juncus balticus*, *J. bufonius*, *J. effusus*, and *J. patens*), beardless wildrye (*Elymus triticoides*), and water iris (*Iris pseudacorus*).

Riparian Woodland

Riparian woodlands in the survey area are tree-dominated areas that are subject to frequent hydrologic influence from the LAR. These areas are dominated by Fremont cottonwood (*Populus fremontii*), Goodding's willow (*Salix gooddingii*), red willow (*S. laevigata*), white alder (*Alnus rhombifolia*), Oregon ash (*Fraxinus latifolia*), and/or California sycamore (*Platanus racemosa*). Pacific willow (*Salix lasiandra*), valley oak, American elm (*Ulmus americana*), and black locust as less frequent contributors to the tree canopy. Riparian woodlands support a variety of shrubs and herbs similar to those described above for the riparian scrub community.

Wildlife Habitat Relationships with Valley Foothill Riparian

Many wildlife species are dependent on riparian habitats for water, food, and cover. Several species of raptors—red-shouldered hawk, Cooper's hawk, great horned owl, and the State-listed Swainson's hawk—build their nests in the crowns of cottonwood, valley oak, and other large trees that grow on the landside and waterside of the levees in the survey area. Natural cavities and woodpecker holes provide nesting sites for cavity-nesting species, including wood duck (*Aix sponsa*), common merganser (*Mergus merganser*), American kestrel, tree swallow (*Tachycineta bicolor*), western bluebird, and western screech owl (*Megascops kennicottii*).

Riparian scrub supports large numbers of insects and attracts passerine birds, including several species of flycatchers, warblers, and hummingbirds. In addition, a number of Federally listed species rely on riparian corridors, including VELB and the western yellow-billed cuckoo. Riparian habitat is listed as a sensitive natural community by the CNDDB (CDFW, 2018) and includes Great Valley cottonwood riparian forest and Northern California black walnut.

3.1.4 Riverine

Riverine habitat includes inundated areas including the LAR. Such areas support some submerged aquatic vegetation including Brazilian waterweed (*Egeria densa*), curly pondweed (*Potamogeton crispus*), and water primrose (*Ludwigia hexapetala*).

Shaded Riverine Aquatic Habitat

Shaded riverine aquatic habitat is defined as the nearshore aquatic area located at the interface between a river and adjacent woody riparian habitat. This valuable cover type has two principal attributes: (1) The adjacent bank is composed of natural, eroding substrates supporting riparian vegetation that either overhangs or protrudes into the water; and (2) the water contains variable amounts of woody debris, such as leaves, logs, branches, and roots, as well as variable depths, velocities, and currents. Shaded riverine aquatic habitat is present throughout the survey area along the riverbanks and levees and is contained within the other identified habitat types in these areas.

Wildlife Habitat Relationships with Riverine

Many bird species use open waters for resting, hunting, and escape cover. Common species include gulls, waterfowl, osprey (*Pandion haliaetus*), and bald eagle (*Haliaeetus leucocephalus*). Shorelines provide hunting grounds for wading birds such as herons and egrets, and for kingfisher, waterfowl, and shorebirds. Flycatchers, swallows, and other insectivorous birds catch their prey over water. Mammal species that occur in this habitat type include river otter (*Lontra canadensis*) and beaver (*Castor canadensis*).

3.1.5 Disturbed/Developed

The levee system has substantially altered the habitat within the LAR parkway and surrounding areas are urbanized. In addition to the levee system, existing facilities in the survey area include a golf course, a bike path, a large pump facility, and three bridges (Figure 3). Staging and access areas are located mostly in existing parking areas, open parks, and on existing gravel or paved roads and paths. Disturbed portions of the survey area include bare ground or manicured areas that are subject to continued disturbance.

Invasive Plant Species

In the survey area, invasive non-native plant species occur in all plant communities, but most commonly with and adjacent to annual grasslands. Areas dominated by non-native vegetation are generally associated with recent human disturbance and include dredged mine tailings, maintained levee slopes, landscaped areas, and areas subject to frequent flood inundation or scour. Non-native weeds dominate some areas, especially along the side slopes of the levees. To a lesser degree, invasive plants are also found in other plant communities such as riparian and oak woodland.

Non-native Woodland

Several locations in the survey area are dominated by non-native trees. These single-species tree stands consist of either Australian pine (*Casuarina equisetifolia*), black locust (*Robinia pseudoacacia*), or tree of heaven (*Ailanthus altissima*). With the exception of black locust stands, non-native woodlands in the survey area do not support a shrub understory, and are dominated by the common herbaceous species described above for California annual grassland. Some black locust stands support blue elderberry shrubs in the understory.

Irrigated Turf

The Campus Commons Golf Course and University Park contain irrigated lawns that are mowed regularly and are dominated by Bermuda grass. Irrigated turf is not considered a sensitive natural community.

Wildlife Habitat Relationships with Disturbed/Developed

The survey area outside of the LAR parkway combines urban residential zones featuring lawns, shade trees, and ornamental plants with areas of mature vegetation as encountered in the parks, on the university campus, and along the periphery of the golf course. Although these areas are disturbed, they can still support wildlife, and the more mature areas can sometimes approximate the natural environment. Bird species that may use these habitat types include scrub jay, Northern mockingbird (*Mimus polyglottos*), house finch (*Carpodacus mexicanus*), California quail, and western bluebird. Common mammals include black-tailed deer, raccoon (*Procyon lotor*), and opossum (*Didelphis virginiana*). Gopher snake and western fence lizard also occur in this habitat type.

Wildlife also use manmade structures such as the H Street Bridge, which is being used as a day roost for unidentified bat species (possibly pallid bat [*Antrozous pallidus*] and/or myotis bats [*Myotis* sp.]). Cliff swallows were observed nesting on the Howe Avenue Bridge. The potential also exists for nesting birds to occur in the trees located in the parking lots and dog park that would be used for Project staging areas.

3.2 Special-Status Species

Several wildlife species known to occur in or in the vicinity of the survey area are protected under Federal and/or State endangered species laws or have been designated as species of special concern by CDFW. In addition, Section 15380(b) of the State CEQA Guidelines provides a definition of rare, endangered, or threatened species that are not included in any listing. Species recognized under these terms are referred to collectively as “special-status species.”

A list of special-status wildlife species with potential to occur in or in the vicinity of the survey area was compiled from a nine-quadrangle search of the CNDDB (CDFW, 2019a), a search of the USFWS Information for Planning and Consultation endangered species database (USFWS, 2019), and biological literature of the region. The search encompassed the following 7.5-minute U.S. Geological Survey topographic quadrangles:

Taylor Monument	Rio Linda	Citrus Heights
Sacramento West	Sacramento East	Carmichael
Clarksburg	Florin	Elk Grove

Each species on the list was assessed individually based on its habitat requirements and distribution relative to the location and vegetation communities that occur in and around the survey area. **Table 1** provides a comprehensive list of special-status wildlife species that were considered in the analysis. Those species with a moderate or high potential to occur in the survey area are described below in greater detail. See **Figure 4** for a map of CNDDB special-status species occurrences within five miles of the survey area. If habitat was not present or the survey area is outside of the known range of the species, the species was assumed absent and excluded from the list.

The "Potential to Occur" categories are defined as follows:

- **Low**: The survey area provides only limited and low-quality habitat for a particular species. In addition, the known range for a particular species may be outside of the survey area.
- **Moderate**: The survey area and/or immediate vicinity provides suitable habitat for a particular species.
- **High**: The survey area and/or immediate vicinity provide ideal habitat conditions for a particular species and/or known populations occur in the survey areas or within its immediate vicinity.
- **Present:** The species was observed during the biological surveys within the survey area.

TABLE 1
SPECIAL-STATUS ANIMAL SPECIES CONSIDERED IN THE SURVEY AREA

Common Name Scientific Name	Status Fed/State	Habitat	Potential to Occur
Listed Species			
Invertebrates			
Crotch bumble bee *Bombus crotchii*	–/CP	Open grasslands and scrub habitat in California with available underground nesting habitat in fossorial animal burrows.	**Moderate.** Annual grassland and scrub habitats are available and several commonly visited flower species were identified as occurring in the survey area. However, there are few recent sightings in the vicinity.
Western bumble bee *Bombus occidentalis occidentalis*	–/CP	Nests, forages, and overwinters in meadows and grasslands with abundant floral resources and available underground nesting habitat in fossorial animal burrows. Range is throughout California, but more common in the Sierra Nevada and Coast Ranges than in the Central Valley.	**Low.** Grassland habitat is available, but the western bumble bee is uncommon in the Central Valley.

TABLE 1
SPECIAL-STATUS ANIMAL SPECIES CONSIDERED IN THE SURVEY AREA

Common Name Scientific Name	Status Fed/State	Habitat	Potential to Occur
Valley elderberry longhorn beetle *Desmocerus californicus dimorphus*	FT/–	Mature elderberry shrubs.	**High.** Elderberry plants are present in the survey area. Exit holes observed.
Reptiles			
Giant garter snake *Thamnophis gigas*	FT/CT	Permanent or semipermanent water and dense emergent vegetation; freshwater marshes, streams, and canals with permanent water.	**Low.** The American River lacks suitable habitat (USFWS AFRC BO 2014-F-0518).
Birds			
Western yellow-billed cuckoo *Coccyzus americanus occidentalis*	FT/CE	In California, western cuckoos are largely restricted to river valleys in the north-central (e.g., Sacramento River) and southwestern (e.g., Kern River) regions. Western cuckoos prefer to nest in willow (*Salix* spp.), cottonwood (*Populus* spp.), and mesquite (*Prosopis* spp.), but they will also use orchards.	**Moderate.** Vocalization recently documented approximately three miles upstream on a densely forested island in the American River. Submarginal nesting habitat occurs in the survey area, but it may be used by transient birds.
Tricolored blackbird *Agelaius tricolor*	–/CT	Breeds near freshwater in dense emergent vegetation or dense brush.	**Low.** Marginal nesting habitat in the willow riparian area. Closest known occurrence is greater than five miles away.
Swainson's hawk *Buteo swainsoni*	–/CT	Often nests near riparian systems, but will also use lone trees in agricultural fields or pastures and roadside trees when available and adjacent to suitable foraging habitat.	**High.** Known to occur within 0.5 miles of the survey area.
Bank swallow (nesting) *Riparia riparia*	–/CT	Colonial nester mostly along coastal areas and rivers in Northern and Central California. Nesting restricted to vertical banks or bluffs with friable soils suitable for burrowing. Vegetation is varied; nesting sites are selected mostly based on the suitability of the nesting bank.	**Moderate.** Previously observed approximately 0.5 miles downstream of the survey area. No bank nesting habitat observed within the survey area, but may use the survey area for foraging.
Nonlisted Special-Status Species			
Reptiles			
Western pond turtle *Actinemys marmorata*	–/CSC	Variety of aquatic habitats, both permanent and intermittent, with suitable aerial and aquatic basking sites. Needs upland habitats for nesting, overwintering, and aestivating.	**Present**. Observed in the survey area during surveys.
Birds			
Cooper's hawk *Accipiter cooperii*	–/WL	A common migrant and winter resident. Nests and forages in a wide variety of forest and woodland habitats.	**High**. Known to occur within 0.5 miles of the survey area.
Great egret *Ardea alba*	MBTA/–	Colonial nester in large trees. Rookery sites located near marshes, tide flats, irrigated pastures, and margins of rivers and lakes.	**Moderate**. Potential nesting habitat in the survey area. There is an egret rookery approximately five miles upstream of the survey area on the American River.

TABLE 1
SPECIAL-STATUS ANIMAL SPECIES CONSIDERED IN THE SURVEY AREA

Common Name Scientific Name	Status Fed/State	Habitat	Potential to Occur
Great blue heron (rookery site) *Ardea herodias*	MBTA/–	Variety of habitats near sources of water. Nests commonly high in the tops of secluded large snags or live trees.	**Moderate**. Potential nesting habitat in the survey area. There is a heron rookery within five miles downstream of the survey area on the American River.
Burrowing owl *Athene cunicularia*	–/CSC	Nests and roosts in burrows, usually of ground squirrels, in grasslands and ruderal habitats.	**High**. Known to occur in the survey area near the university. Several ground squirrel burrows observed along the levee corridor.
White-tailed kite (nesting) *Elanus leucurus*	–/FP	Savanna, open woodland, marshes, partially cleared lands and cultivated fields, mostly in lowland habitats. Nests in trees, often near marshes.	**High**. Known to occur in the survey area on the south side.
Purple martin *Progne subis*	–/CSC	Nests mostly in old woodpecker cavities; also nests in human-made structures. Nest is often located in tall, isolated trees/snags.	**Moderate**. Potential nesting habitat in the survey area. Known to occur on bridge and overpass structures within one mile of the survey area.
Mammals			
Pallid bat *Antrozous pallidus*	–/CSC	Arid deserts and grasslands of low elevations in California; often near rocky outcrops and water. Usually roosts in rock crevices or buildings, less often in caves, tree hollows, mines, etc. Prefers narrow crevices in caves as hibernation sites.	**High**. This species may roost in buildings and bridges in the survey area; however, roosting is not reported by the CNDDB within five miles of the survey area or within the nine-quadrangle area that includes the survey area.
Western red bat *Lasiurus blossevillii*	–/CSC	Associated with riparian habitat. Roosts primarily in the foliage of trees or shrubs, but may also occasionally use caves. Day roosts commonly in edge habitats.	**High**. This species may roost in mixed oak woodland habitat in the survey area; however, roosting is not reported by the CNDDB within five miles of the survey area or within the nine-quadrangle area that includes the survey area.
American badger *Taxidea taxus*	–/CSC	Requires sufficient food, friable soils to excavate dens and pursue prey, and relatively open, uncultivated ground.	**Moderate.** The potential exists for this species to use the parkway. Although no signs of presence were observed, there were small fossorial mammal burrows and ground squirrel activity. There are two known occurrences within five miles; however, the most recent sighting was from 1991.

Figure 4
Special-status Species Occurrences within 5 miles of the Survey Area

ESA

The analysis below includes consideration of special-status species categorized as present, or with a medium or high potential to occur.

3.2.1 Federally Listed and State-Listed Wildlife Species

Crotch Bumble Bee

The crotch bumble bee was recommended to be added to the State endangered species list and was listed as a candidate species by CDFW in June 2019. It inhabits open grassland and scrub habitats throughout California. Crotch bumble bees primarily nest underground in mammal burrows, but are occasionally observed in old logs and cavities in trees, among other aboveground locations. They are generalist foragers, with short tongues, and thus have a preference for foraging on open flowers with short corollas. They overwinter in soft disturbed soil or under leaf litter (CDFW, 2019b).

This species was historically common throughout the Central Valley, but now is mostly absent. The closest somewhat recent occurrence documented in the CNDDB, last recorded in 1998, was just southwest of Davis, approximately 18 miles west of the Project area. Two more recent occurrences were documented in the CNDDB in 2007; the first was just outside of Fairfield, approximately 36 miles to the southwest, and the second was near the Tisdale Weir in Colusa County, approximately 38 miles to the north. More recent occurrences are in the Sierra Nevada and the Coast Ranges. Nonetheless, suitable habitat occurs in the survey area in annual grassland and scrub habitats.

Valley Elderberry Longhorn Beetle

The valley elderberry longhorn beetle is Federally listed as threatened. Suitable habitat for the VELB is typically defined as live elderberry (*Sambucus* spp.) stems measuring at least one inch in diameter at ground level. These beetles seldom occur above 3,000 feet in elevation. They are generally found along waterways and in floodplains that support remnant stands of riparian vegetation. The VELB is completely dependent on its host plant, the elderberry, which is a common component of the riparian forests and adjacent upland habitats of California's Central Valley and foothills. Elderberry shrubs with VELB populations occur in a variety of habitats and plant communities, but are most often found in riparian areas (USFWS, 1999, 2017).

Records for this species are restricted to small, scattered populations along the Sacramento, American, San Joaquin, Kings, Kaweah, and Tule Rivers and their tributaries. However, the species has the potential to occupy shrubs in the Central Valley and Sierra Nevada foothills. For this reason, elderberry shrubs of sufficient size (measuring at least one inch in diameter at ground level) are considered suitable habitat for this species. There are documented occurrences of VELB in the survey area from 1984, when 11 beetles were captured. Fresh exit holes were observed in 2009 (CDFW, 2019a), 2018 (Environmental Science Associates, 2018), and during this survey.

Yellow-billed Cuckoo

The western yellow-billed cuckoo is a subspecies of the yellow-billed cuckoo and has been recognized through designation of a distinct population segment (USFWS, 2001). In 1988, the cuckoo was listed by the State as endangered under the California Endangered Species Act (CDFW, 2019c). In 2014, the cuckoo was Federally listed as threatened under the Federal Endangered Species Act, and critical habitat was proposed throughout its range, including a 69-mile-long, contiguous segment of the Sacramento River from Red Bluff to Colusa (USFWS, 2014a, 2014b). The cuckoo is typically found in riparian forests with dense deciduous trees and shrubs, primarily in riparian forests and associated bottomlands dominated by willow, cottonwood, or mesquite (Gaines and Laymon, 1984; Laymon and Halterman, 1987; Hughes, 1999; Halterman et al., 2001).

This subspecies was once common throughout California (Grinnell and Miller, 1944), but the population has declined over the last 100 years following extensive loss of riparian habitat. In California, cuckoos are consistently found in only a few isolated areas: the Sacramento Valley (between Red Bluff and Colusa), the Feather River (between Gridley and Nicolaus), the South Fork of the Kern River, and several Lower Colorado River Multi-Species Conservation Program restoration sites on the California side of the lower Colorado River (Gaines and Laymon, 1984; Laymon and Halterman, 1989; Laymon, 1998; Halterman et al., 2001; Dettling and Seavy, 2012).

Until recently, the Upper Sacramento River was believed to have one of the largest cuckoo populations in California. However, surveys have documented a dramatic decline in this population (Halterman et al., 2001; Dettling and Howell, 2011; Dettling et al., 2014). Riparian vegetation in this area has increased by almost 5,000 acres since 1996 as a result of restoration efforts (Golet et al., 2008). Gaines and Laymon (1984) suggested, however, that many large patches along the Sacramento River in Tehama County and along the Feather River appeared to be unoccupied even though they apparently represent suitable habitat. Follow-up surveys were conducted in 1987 and 1999, and between one and six individuals were found along the Feather River between Oroville and Nicolaus (Laymon and Halterman, 1989; Halterman et al., 2001).

Until very recently, the last documented occurrence in the CNDDB in the vicinity of the survey area was from the late 1800s. However, on July 27, 2019, a cuckoo vocalization was documented approximately three miles upstream on a heavily forested island in the American River (Ron Melcer Jr., Delta Stewardship Council, pers. comm., July 28, 2019). The bird was not observed and the nesting status is unknown.

The survey area provides marginal remnant riparian habitat that may be used for foraging or dispersal. However, the riparian habitat in the survey area does not meet the typical size requirements (25 contiguous acres or more) for home ranges of nesting yellow-billed cuckoos (USFWS, 2001).

Swainson's Hawk

Swainson's hawk is State-listed as threatened. It once occupied large grassland and shrub steppe habitats, as well as canyons, foothills, and smaller interior valleys in otherwise mountainous

regions. Currently, the species is most common in the Central Valley and Great Basin. Nesting habitat for Swainson's hawk includes mature trees with relatively dense canopies such as oaks or cottonwoods in or near riparian habitat, agricultural fields, or suburban neighborhoods near suitable foraging habitat. They forage in grasslands, irrigated pastures, and grain fields. In California, Swainson's hawks begin nesting in late March, and the young usually leave the nest (fledge) by August.

The closest CNDDB occurrence of Swainson's hawk is approximately 0.5 miles west of the survey area. The pair was last observed nesting in 2011. A pair was observed in the same vicinity in 2012, but nesting was not confirmed. The most recently documented CNDDB occurrence, in 2017, was a nest approximately 1.5 miles west of the survey area. Additionally, there has been a regularly documented nest just upstream of Howe Avenue (Sorgen, K. C. pers. comm., 2019) and a potential nesting pair was observed in May 2019 by a DWR survey team on the river's right bank just downstream of Watt Ave, approximately 1.4 miles east of the survey area (Lori Price, pers. comm., 2019). The survey area and landscape within 0.5 miles was assessed for potential Swainson's hawk nesting and foraging habitat. The large trees within the riparian corridor and adjacent parks could provide nesting sites and annual grasslands and nearby parks provide suitable foraging habitat.

Bank Swallow

The bank swallow is State-listed as threatened. It is a neotropical migrant that arrives in California in May and breeds before returning to South America in late July or August. Swallows primarily inhabit riparian and lowland habitats with vertical banks, bluffs, and cliffs where they dig holes for nesting in sandy or fine-textured soil (CDFG, 1999a). The species' range in California is estimated to have been reduced by 50 percent since 1900 (CDFG, 1999a). Bank swallow was formerly more common as a breeder in California. Now, only approximately 110–120 colonies remain in the state. Perhaps 75 percent of the current breeding population in California occurs along the banks of the Sacramento and Feather Rivers in the northern Central Valley (CDFG, 1999a).

Historically, a population of nesting bank swallows, was documented in the CNDDB, approximately 0.5 miles downstream of the survey area. The most recent record was from for this location 1986. The closest recent (2017) CNDDB record is from the vicinity of Knights Landing, which is 17 miles from the survey area. Although nesting habitat in the survey area is limited, as the banks are mostly covered in dense vegetation, there is high-quality foraging habitat that bank swallows may use.

3.2.2 Nonlisted Special-Status Wildlife Species

Western Pond Turtle

The western pond turtle is a California species of special concern. This moderate-sized aquatic turtle is commonly found in ponds, lakes, marshes, rivers, streams, and irrigation ditches with rocky or muddy substrates. Its habitat often exhibits shoreline basking areas that may or may not be bordered by aquatic vegetation. Aquatic sites are often within woodlands, grasslands, and open forests, between sea level and 6,000 feet in elevation. Pond turtles bask on logs or other objects when

water temperatures are lower than air temperatures. Their nests are created in upland areas with friable soils, often up to 0.25 miles from an aquatic site (Jennings and Hayes, 1994; Stebbins, 2003; Zeiner et al., 1988).

Western pond turtles are discontinuously distributed throughout California west of the Cascade-Sierran crest (Jennings and Hayes, 1994). They were documented by the CNDDB within the nine-quadrangle area and were observed in the survey area just downstream of the Campus Commons Golf Course, on river right, basking on a log in the water.

Cooper's Hawk

The Cooper's hawk is a CDFW watch list species. This medium-sized accipiter is a resident of wooded areas throughout California, with breeding described throughout the Coast Ranges and Sierra Nevada foothills. The Cooper's hawk forages mostly on small birds and mammals, although it will also take reptiles and amphibians. The species' peak nesting season is May through July, although nesting may occur any time from March to August (Zeiner et al., 1990a).

A Cooper's hawk nest was recorded by the CNDDB within one mile south of the survey area in 2007 (CDFW, 2019a). Woodland habitat in and near the survey area provides potential nesting opportunities for this species.

Western Burrowing Owl

Western burrowing owls are California species of special concern. They inhabit grassland, desert, and open shrub habitats throughout the state from sea level to approximately 5,300 feet (CDFG, 1999b). Unlike many sensitive species, burrowing owls persist and even thrive in some landscapes that are highly altered by human activity. The characteristics of suitable habitat are burrows for roosting and nesting, and relatively short vegetation with only sparse shrubs and taller vegetation. Individuals in agricultural environments nest along roadsides and water conveyance structures. Breeding occurs February through August (CDFG, 2012).

The closest CNDDB occurrence of burrowing owl is just east of Site 2-1 on the university campus and approximately 0.5 miles east of the survey area. The levee and bike path along the project corridor in the survey area, especially Site 2-2, consists of disturbed grasslands with small mammal burrows and ground squirrel activity. This area provides potential nesting habitat for burrowing owl. During reconnaissance-level surveys, no burrowing owls or signs of occupied burrows were found.

White-Tailed Kite

The white-tailed kite is a fully protected species under the California Fish and Game Code. This species nests primarily in riparian and lowland habitats often associated with agricultural areas throughout cismontane California. White-tailed kites typically nest in dense vegetation at the tops of oaks, willows, or other native trees. They prey primarily on voles and other diurnal mammals (CDFG, 2005). Their numbers and range have increased in the past few decades (CDFG, 2005).

There are two known CNDDB occurrences of white-tailed kite in the survey area, the most recent documented in 2009. The survey area provides trees suitable for nesting and potential foraging habitat is available along the levees and in nearby parks and open grasslands. White-tailed kites were not observed during the surveys.

Other Breeding and Migratory Birds

The Federal Migratory Bird Treaty Act and California Fish and Game Code protect raptors, most native migratory birds, and breeding birds that could be present in the survey area. The LAR parkway corridor provides high-quality foraging and nesting opportunities for a variety of resident and migratory birds. Common raptor species that may nest in the mature trees of the parkway could include red-tailed hawk, red-shouldered hawk (observed), and great horned owl. Wading birds such as the great egret and the great blue heron are known to nest upstream and downstream of the survey area, and have been observed foraging in the survey area. Among the many passerine species observed in the survey area and with the potential to nest are western scrub jay, acorn woodpecker, downy woodpecker, northern flicker, black phoebe, American robin, western bluebird, and ash-throated flycatcher. Cliff swallows were observed nesting under the Howe Avenue Bridge. Purple martin, a California species of special concern, is also known to occur in the area and has the potential to nest in the survey area. A full list of species observed in the survey area is provided in Appendix B, Table B-1.

Pallid Bat

The pallid bat, a California species of special concern, occurs throughout California except in parts of the high Sierra and the northwestern corner of the state (Zeiner et al., 1990b). The pallid bat inhabits a variety of habitats, such as grasslands, shrublands, woodlands, and forests; however, it is most abundant in open, dry habitats with rocky areas for roosting. Pallid bats roost alone, in small groups, or gregariously (WBWG, 2005). Roosts include caves, crevices in rocky outcrops and cliffs, mines, trees, and various manmade structures (e.g., bridges, barns, porches); they generally have unobstructed entrances/exits and are high above the ground, warm, and inaccessible to terrestrial predators. Year-to-year and night-to-night roost reuse is common; however, bats may switch day roosts on a daily and seasonal basis (WBWG, 2005).

The pallid bat is the most widely described special-status bat species in central California. No occurrences are reported within five miles of the survey area, or within the nine-quadrangle area that includes the survey area. However, during reconnaissance-level surveys, bats were observed using the H Street Bridge for a day roost. The bats were not identified to species, but the bridge may provide suitable roosting habitat for this species.

Western Red Bat

The western red bat is a California species of special concern. This is a riparian obligate species (i.e., dependent on riparian habitat) that is ubiquitous throughout California except the northern Great Basin region. Western red bats roost individually in dense clumps of tree foliage in riparian areas, orchards, and suburban areas. They are primarily moth specialists, but will forage for a variety of other insects. Individuals have been observed foraging around street lamps and floodlights in suburban areas (WBWG, 2005).

Based on its tendency to roost within tree foliage, this species may be intermittently present in the riparian and woodland habitat in the survey area; however, roosting occurrences are not reported by the CNDDB within five miles of the survey area or within the nine-quadrangle area that includes the survey area.

American Badger

The American badger is a California species of special concern. This species prefers open grasslands and riparian habitat within the valley areas, although it occurs throughout multiple habitat types in California. The principal requirements seem to be sufficient food, friable soils to excavate dens and pursue prey, and relatively open, uncultivated ground. In California, badgers range throughout the state, except for the humid coastal forests of northwestern California in Del Norte County and the northwestern portion of Humboldt County (Williams, 1986).

Reconnaissance-level wildlife surveys of the survey area in summer did not detect any badger excavations or other signs of species presence. This species was previously observed in the vicinity of the survey area (two miles to the south), but the observation is almost 30 years old. Nonetheless, suitable habitat occurs in the survey area in annual grasslands.

Critical Habitat for Listed Wildlife Species

USFWS defines the term “critical habitat” in the Federal Endangered Species Act as a specific geographic area(s) that contains features essential for the conservation of a threatened or endangered species and that may require special management and protection. The survey area is not within designated critical habitat for any listed terrestrial wildlife species.

Natural Communities Crosswalk

TABLE A-1
CROSSWALK TABLE OF NATURAL COMMUNITIES

Natural Community	CWHR	Manual of California Vegetation Alliance
Annual grassland	Annual grassland	Annual brome grassland
		Yellow star-thistle fields
		Western ragweed meadow
		Wild oats grassland
		Poison hemlock or fennel patch
Oak woodland	Coastal oak woodland	Coast live oak woodland
	Valley oak woodland	Valley oak woodland
		Hind's walnut and related stand
	Montane hardwood	Interior live oak woodland
Upland scrub	Coastal scrub	Coyote brush scrub
	Valley foothill riparian	California rose briar patch
		Coastal bramble
		Blue elderberry stand
Non-native woodland	Eucalyptus	Eucalyptus–tree of heaven–black locust grove
Riparian woodland	Valley foothill riparian	Fremont cottonwood forest
		Box-elder forest
		Red willow thicket
		Black willow thicket
		White alder grove
		Valley oak woodland
		California sycamore woodland
		Oregon ash grove
Riparian scrub	Valley foothill riparian	Sandbar willow thicket
		Arroyo willow thicket
		Pacific willow thicket
		Button willow thicket
		Blue elderberry stand
		California rose briar patch

NOTES:

CWHR = California Wildlife Habitat Relationship System

* Areas dominated by non-native trees, and some native shrubs, do not conform to recognized *Manual of California Vegetation* alliances.

** Areas with remnant riparian species that no longer experience hydrologic influence are now considered upland habitat types.

Appendix B
Wildlife and Plant Species Observed during Reconnaissance Surveys

TABLE B-1
WILDLIFE SPECIES OBSERVED IN THE SURVEY AREA

COMMON NAME	SCIENTIFIC NAME
REPTILES	
western pond turtle	*Actinemys marmorata*
western fence lizard	*Sceloporus occidentalis*
red-eared slider	*Trachemys scripta elegans*
BIRDS	
red-shouldered hawk	*Accipiter striatus*
mallard	*Anas platyrhynchos*
western scrub-jay	*Aphelocoma californica*
great egret	*Ardea alba*
Canada goose	*Branta canadensis*
California quail	*Callipepla californica*
Anna's hummingbird	*Calypte anna*
house finch	*Carpodacus mexicanus*
turkey vulture	*Cathartes aura*
northern flicker	*Colaptes auratus*
rock dove	*Columba livia*
American crow	*Corvus brachyrhynchos*
dark-eyed junco	*Junco hyemalis*
belted kingfisher	*Megaceryle alcyon*
acorn woodpecker	*Melanerpes formicivorus*
wild turkey	*Meleagris gallopavo*
song sparrow	*Melospiza melodia*
California towhee	*Melozone crissalis*
common merganser	*Mergus merganser*
northern mockingbird	*Mimus polyglottos*
ash-throated flycatcher	*Myiarchus cinerascens*
cliff swallow	*Petrochelidon pyrrhonota*
Nuttall's woodpecker	*Picoides nuttallii*
spotted towhee	*Pipilo maculatus*
bushtit	*Psaltriparus minimus*
black phoebe	*Sayornis nigricans*
western bluebird	*Sialia mexicana*
lesser goldfinch	*Spinus psaltria*
European starling	*Sturnus vulgaris*
house wren	*Troglodytes aedon*
American robin	*Turdus migratorius*
mourning dove	*Zenaida macroura*

WILDLIFE SPECIES OBSERVED IN THE SURVEY AREA

COMMON NAME	SCIENTIFIC NAME
MAMMALS	
bat (unidentified to species)	unknown
coyote	*Canis latrans*
American beaver	*Castor canadensis*
black-tailed jackrabbit	*Lepus californicus*
black-tailed deer	*Odocoileus hemionus*
western gray squirrel	*Sciurus griseus*
brush rabbit	*Sylvilagus bachmani*

TABLE B-2
PLANT SPECIES OBSERVED IN THE SURVEY AREA

Scientific Name	Common Name	Family
Acer buergerianum	trident maple	Sapindaceae
Acer negundo	boxelder	Sapindaceae
Acer saccharinum	silver maple	Sapindaceae
Acmispon americanus	American bird's foot trefoil	Fabaceae
Aesculus californica	California buckeye	Sapindaceae
Agrostis avenacea	Pacific bentgrass	Poaceae
Agrostis stolonifera	creeping bentgrass	Poaceae
Ailanthus altissima	tree of heaven	Simaroubaceae
Alnus rhombifolia	white alder	Betulaceae
Amaranthus albus	tumbleweed	Amaranthaceae
Ambrosia psilostachya	ragweed	Asteraceae
Anthemis cotula	stinking chamomile	Asteraceae
Anthriscus caucalis	bur chervil	Apiaceae
Apocynum cannabinum	Indian hemp	Apocynaceae
Aristolochia californica	California pipe vine	Aristolochiaceae
Artemisia douglasiana	California mugwort	Asteraceae
Artemisia dracunculus	wild tarragon	Asteraceae
Avena barbata	slender oat	Poaceae
Baccharis pilularis ssp. *consanguinea*	coyote brush	Asteraceae
Baccharis salicifolia	mule fat	Asteraceae
Betula sp.	birch	Betulaceae
Bidens frondosa	sticktight	Asteraceae
Brassica nigra	black mustard	Brassicaceae
Brickellia californica	California brickellia	Asteraceae
Bromus catharticus	rescue grass	Poaceae

TABLE B-2
PLANT SPECIES OBSERVED IN THE SURVEY AREA

Scientific Name	Common Name	Family
Bromus diandrus	ripgut brome	Poaceae
Bromus hordeaceus	soft brome	Poaceae
Cardamine oligosperma	bitter cress	Brassicaceae
Carduus pycnocephalus	Italian thistle	Asteraceae
Carex barbarae	Santa Barbara sedge	Cyperaceae
Casuarina equisetifolia	Australian pine	Casuarinaceae
Catalpa bignonioides	Southern catalpa	Bignoniaceae
Celtis australis	European hackberry	Cannabaceae
Centaurea solstitialis	yellow star thistle	Asteraceae
Centromadia pungens ssp. *pungens*	common tarweed	Asteraceae
Cephalanthus occidentalis	common buttonbush	Rubiaceae
Cercis occidentalis	Western redbud	Fabaceae
Chenopodium album	lambs quarters	Chenopodiaceae
Chondrilla juncea	skeleton weed	Asteraceae
Cinnamomum camphora	camphortree	Lauraceae
Clarkia unguiculata	elegant clarkia	Onagraceae
Clematis lasiantha	pipestem	Ranunculaceae
Conium maculatum	poison hemlock	Apiaceae
Convolvulus arvensis	field bindweed	Convulvulaceae
Crassula aquatica	water pigmyweed	Crassulaceae
Croton setiger	turkey-mullein	Euphorbiaceae
Cuscuta subinclusa	canyon dodder	Convulvulaceae
Cynodon dactylon	Bermuda grass	Poaceae
Cynosurus echinatus	dogtail grass	Poaceae
Cyperus eragrostis	tall flatsedge	Cyperaceae
Cyperus esculentus	yellow nutgrass	Cyperaceae
Datura wrightii	jimsonweed	Solanaceae
Daucus carota	wild carrot	Apiaceae
Digitaria sanguinalis	hairy crabgrass	Poaceae
Dittrichia graveolens	stinkwort	Asteraceae
Dysphania ambrosioides	Mexican tea	Chenopodiaceae
Egeria densa	brazilian waterweed	Hydrocharitaceae
Elymus triticoides	beardless wildrye	Poaceae
Epilobium brachycarpum	annual fireweed	Onagraceae
Epilobium ciliatum	slender willow herb	Onagraceae
Equisetum arvense	common horsetail	Equisetaceae
Equisetum hymale ssp. affine	common scouring rush	Equisetaceae
Erigeron canadensis	Canada horseweed	Asteraceae
Erodium botrys	long-beaked filaree	Geraniaceae

TABLE B-2
PLANT SPECIES OBSERVED IN THE SURVEY AREA

Scientific Name	Common Name	Family
Erodium cicutarium	red-stemmed filaree	Geraniaceae
Erodium moschatum	white-stemmed filaree	Geraniaceae
Erythranthe guttata	yellow monkey flower	Phrymaceae
Eschscholzia californica	California poppy	Papaveraceae
Eucalyptus camaldulensis	red river gum	Myrtaceae
Euphorbia maculata	spotted spurge	Euphorbiaceae
Euphorbia peplus	petty spruge	Euphorbiaceae
Festuca myuros	rattail sixweeks grass	Poaceae
Foeniculum vulgare	fennel	Apiaceae
Fraxinus latifolia	Oregon ash	Oleaceae
Fraxinus veluntina	Arizona ash	Oleaceae
Galium aparine	stickywilly	Rubiaceae
Galium murale	tiny bedstraw	Rubiaceae
Galium parisiense	wall bedstraw	Rubiaceae
Geranium dissectum	cutleaf geranium	Geraniaceae
Hedera helix	English ivy	Araliaceae
Helminthotheca echioides	bristly ox-tongue	Asteraceae
Heterotheca grandiflora	telegraph weed	Asteraceae
Heterotheca oregana	Oregon golden aster	Asteraceae
Hirschfeldia incana	wild mustard	Brassicaceae
Hordeum marinum	seaside barley	Poaceae
Hordeum murinum	foxtail barley	Poaceae
Hydrocotyle verticillata	whorled marsh pennywort	Araliaceae
Hypericum perforatum	Klamath weed	Hypericaceae
Iris pseudacorus	water iris	Iridaceae
Isolepis cernua	low bulrush	Cyperaceae
Juglans californica	Southern California black walnut	Juglandaceae
Juglans hindsii	Northern California black walnut	Juglandaceae
Juncus balticus	baltic rush	Juncaceae
Juncus bufonius	toad rush	Juncaceae
Juncus effusus ssp. *pacificus*	Pacific rush	Juncaceae
Juncus patens	spreading rush	Juncaceae
Kickxia elatine	sharp-leaved fluellin	Plantaginaceae
Lactuca serriola	prickly lettuce	Asteraceae
Lathyrus jepsonii var. *californicus*	California tule pea	Fabaceae
Leersia oryzoides	rice cutgrass	Poaceae
Lepidium didymum	lesser swine cress	Brassicaceae
Lepidium latifolium	perennial pepperweed	Brassicaceae
Ligustrum japonicum	Japanese privet	Oleaceae

TABLE B-2
PLANT SPECIES OBSERVED IN THE SURVEY AREA

Scientific Name	Common Name	Family
Lindernia dubia	yellowseed false pimpernel	Plantaginaceae
Liquidambar styraciflua	sweetgum	Hamamelidaceae
Logfia gallica	narrowleaf cottonrose	Asteraceae
Ludwigia hexapetala	ludwigia	Onagraceae
Lysimachia arvensis	scarlet pimpernel	Myrsinaceae
Lythrum hyssopifolia	hyssop loosestrife	Lythraceae
Madia elegans	common madia	Asteraceae
Malva neglecta	common mallow	Malvaceae
Marah fabacea	California man-root	Cucurbitaceaev
Marrubium vulgare	white horehound	Lamiaceae
Medicago polymorpha	bur clover	Fabaceae
Melilotus albus	white sweet clover	Fabaceae
Melilotus indicus	annual yellow sweet clover	Fabaceae
Mentha pulegium	pennyroyal	Lamiaceae
Morus alba	white mulberry	Moraceae
Myriophyllum aquatica	parrot's feather	Haloragaceae
Nerium oleander	oleander	Apocynaceae
Nicotiana acuminata var. *multiflora*	may flowered tobacco	Solanaceae
Nicotiana glauca	tree tobacco	Solanaceae
Oenothera elata	evening primrose	Onagraceae
Olea europaea	olive	Oleaceae
Oxalis radicosa	dwarf woodsorrel	Oxalidaceae
Paspalum dilatatum	dallis grass	Poaceae
Paspalum distichum	knot grass	Poaceae
Paspalum urvillei	Vasey's grass	Poaceae
Persicaria punctata	dotted smartweek	Polygonaceae
Petrorhagia dubia	Windmill pink	Caryophyllaceae
Phoradendron leucarpum	mistletoe	Viscaceae
Phyla nodiflora	common lippia	Verbenaceae
Phytolacca americana	American pokeweed	Phytolaccaceae
Pistacia chinensis	Chinese pistachio	Anacardiaceae
Plantago lanceolata	narrow leaved plantain	Plantaginaceae
Platanus racemosa	California sycamore	Platanaceae
Platanusx hispanica	London plane tree	Platanaceae
Poa annua	annual blue grass	Poaceae
Polycarpon tetraphyllum var. *tetraphyllum*	four leaved allseed	Caryophyllaceae
Polygonum aviculare	prostrate knotweed	Polygonaceae
Polypogon monspeliensis	rabbitsfoot grass	Poaceae
Portulaca oleracea	common purslane	Portulacaceae

TABLE B-2
PLANT SPECIES OBSERVED IN THE SURVEY AREA

Scientific Name	Common Name	Family
Potamogeton crispus	curly pondweed	Potamogetonaceae
Prunus cerasifera	cherry plum	Rosaceae
Prunus dulcis	domestic almond	Rosaceae
Pseudognaphalium beneolens	cudweed	Asteraceae
Pseudognaphalium luteoalbum	Jersey cudweed	Asteraceae
Pseudognaphalium stramineum	cottonbatting plant	Asteraceae
Quercus agrifolia	coast live oak	Fagaceae
Quercus chrysolepis	canyon live oak	Fagaceae
Quercus ilex	holly oak	Fagaceae
Quercus kelloggii	black oak	Fagaceae
Quercus lobata	valley oak	Fagaceae
Quercus suber	cork oak	Fagaceae
Quercus wislizeni	Interior live oak	Fagaceae
Raphanus sativus	wild radish	Brassicaceae
Robinia pseudoacacia	black locust	Fabaceae
Rorippa curvisiliqua	curvepod yellow cress	Brassicaceae
Rosa californica	California wild rose	Rosaceae
Rubus armeniacus	Himalayan blackberry	Rosaceae
Rubus ursinus	California blackberry	Rosaceae
Rumex conglomeratus	Clustered dock	Polygonaceae
Rumex crispus	curly dock	Polygonaceae
Rumex stenophyllus	narrowleaf dock	Polygonaceae
Salix laevigata	red willow	Salicaceae
Salix lasiandra	Pacific willow	Salicaceae
Salix lasiolepis	arroyo willow	Salicaceae
Salsola tragus	prickly russian thistle	Chenopodiaceae
Sambucus nigra ssp. *caerulea*	blue elderberry	Adoxaceae
Saponaria officinalis	bouncing bet	Caryophyllaceae
Senecio vulgaris	common groundsel	Asteraceae
Sesbania punicea	red sesbania	Fabaceae
Setaria parviflora	marsh bristlegrass	Poaceae
Silybum marianum	milk thistle	Asteraceae
Solanum americanum	white nightshade	Solanaceae
Solanum elaeagnifolium	silver leaved horsenettle	Solanaceae
Sonchus asper	spiny sowthistle	Asteraceae
Sonchus oleraceus	common sow thistle	Asteraceae
Sorghum halepense	Johnsongrass	Poaceae
Spergularia bocconi	Boccone's sand spurry	Caryophyllaceae
Spergularia rubra	purple sand spurry	Caryophyllaceae

TABLE B-2
PLANT SPECIES OBSERVED IN THE SURVEY AREA

Scientific Name	Common Name	Family
Stipa pulchra	purple needle grass	Poaceae
Symphoricarpos albus	common snowberry	Caprifoliaceae
Teraxacum officinale	common dandelion	Asteraceae
Torilis arvensis	field hedge parsley	Apiaceae
Triadica sebifera	Chinese tallowtree	Euphorbiaceae
Tribulus terrestris	puncture vine	Zygophyllaceae
Trifolium hirtum	rose clover	Fabaceae
Trifolium repens	white clover	Fabaceae
Typha latifolia	broadleaf cattail	Typhaceae
Ulmus americana	American elm	Ulmaceae
Ulmus minor	English elm	Ulmaceae
Ulmus parviflora	Chinese elm	Ulmaceae
Ulmus pumila	Siberian elm	Ulmaceae
Umbellularia californica	California bay	Lauraceae
Urtica dioica	stinging nettle	Urticaeae
Verbascum blattaria	moth mullein	Scrophulariaceae
Verbascum thapsus	woolly mullein	Scrophulariaceae
Verbena litoralis	seashore vervain	Verbenaceae
Veronica peregrina ssp. *xalapensis*	purslane speedwell	Plantaginaceae
Vicia villosa	hairy vetch	Fabaceae
Vinca major	bigleaf periwinkle	Apocynaceae
Viola odorata	English violet	Violaceae
Vitis californica	California wild grape	Vitaceae
Xanthium strumarium	rough cockleburr	Asteraceae
Zeltnera muehlenbergii	Meuhlenberg's centaury	Gentianaceae

TABLE OF CONTENTS

American River Common Features 2016 Project American River Contract 1 Special-Status Plant Survey Report

List of Figures

CHAPTER 1
Introduction and Summary

1.1 Introduction

This report documents the results of special-status plant surveys conducted in July 2019 for the American River Common Features 2016 Project, American River Contract 1. Environmental Science Associates (ESA) conducted the surveys on behalf of the U.S. Army Corps of Engineers, Central Valley Flood Protection Board, and Sacramento Area Flood Control Agency. The objective of the surveys was to locate and document any special-status plants in the survey area.

1.2 Summary of Results

Four Sanford's arrowhead (*Sagittaria sanfordii*) plants were observed in the survey area. Sanford's arrowhead is a California Rare Plant Rank (CRPR) 1B.2 species. No other special-status plants were observed.

CHAPTER 2
Methodology

2.1 Survey Area

The survey area is in northwestern Sacramento County, California, within the Sacramento city limits (**Figures 1** and **2**). The survey area totals 134.12 acres, encompassing the project footprint along the Lower American River plus a 20-foot buffer around the project perimeter. It extends from Paradise Bend at approximately river mile 5.4, near the City of Sacramento's Glenn Hall Park, upstream along the American River to just past the Howe Avenue Bridge at approximately river mile 7.9.

The survey area is mostly within the American River Parkway and includes several paved, gravel, and dirt trails. It includes all or portions of the Campus Commons Golf Course, the H Street Bridge, the Guy West Bridge, the Howe Avenue Bridge, and University Park.

The survey area falls within Sections 3, 10, and 11 (Township 8 North, Range 5 East) of the Sacramento East, California U.S. Geological Survey 7.5-minute series quadrangle. The approximate centroid of the survey area is 38.567864º North, 121.422750º West. Elevations range from approximately 17 feet to 47 feet above mean sea level.

Ecologically, the survey area is located within the Great Central Valley subregion of the California Floristic Province (Baldwin et al., 2012). Regional natural plant communities typical of the Central Valley are grassland, mixed oak woodland, upland scrub, riparian woodland, and riparian scrub. Most of the area surrounding the survey area is urbanized.

2.2 Background Research

Before conducting the field surveys, ESA compiled a list of special-status plants that occur or may occur in the vicinity of the survey area and for which suitable habitat may be present in the survey area (**Appendix A**). Data sources consulted included the California Natural Diversity Database (CDFW, 2019); the U.S. Fish and Wildlife Service IPaC Trust Resources Report (USFWS, 2019); and the California Native Plant Society (CNPS) Inventory of Rare and Endangered Plants (CNPS, 2019).

The list compiled includes 21 special-status plants with potential to occur in the regional project vicinity (**Appendix A**). Each species' habitat requirements were compared to available habitats in the survey area to determine the special-status plants with potential to occur in the survey area.

2.3 Field Survey and Follow-Up Visit

The field survey was conducted by ESA botanists Chuck Hughes and Joseph Sanders on July 9, 2019. A follow-up visit was conducted by Chuck Hughes and ESA biologist Emily Dorrance on July 24, 2019. Surveys followed the procedures described in the California Department of Fish and Wildlife (CDFW) *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities* (CDFW, 2018a) and the U.S. Fish and Wildlife Service *Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed and Candidate Plants* (USFWS, 1996).

The surveys were floristic in nature: Every plant taxon found in the survey area was identified to the taxonomic level necessary to determine its rarity and listing status. Botanical taxonomy and nomenclature conform to *The Jepson Manual: Vascular Plants of California,* second edition (Baldwin et al., 2012) as revised by the Jepson eFlora (Jepson Flora Project, 2019).

Conditions at the time of the surveys were typical for summer in western Sacramento County (warm to hot and dry). The timing of the surveys corresponded to the flowering season for all species with at least moderate potential to occur in the survey area based on background research. The survey area was searched systematically using transects spaced about 50 feet apart where vegetation allowed. Frequent deviations were made to thoroughly search areas deemed more suitable for special-status plants, to identify additional plant species, or to go around impenetrable vegetation. Any observed special-status plants were mapped in the field with a global positioning system (GPS). Data were collected on a custom ArcCollector map using an iPad connected to a Trimble R-1, an external, submeter-accuracy GPS receiver.

CHAPTER 3
Setting

3.1 Climate

The survey area's climate is Mediterranean, characterized by warm, dry summers and cool, wet winters. The bulk of precipitation occurs as rain in the winter months. Sacramento's mean annual precipitation is 20.27 inches and temperatures range from a mean annual maximum of 73.1 degrees Fahrenheit to an average minimum temperature of 49.8 degrees Fahrenheit. Precipitation from July 1, 2018, through June 30, 2019, totaled 26.11 inches, 129 percent of average annual rainfall (NWSFO, 2019); the previous winter was wetter than normal. The survey area was experiencing normal dry summertime conditions during the field survey.

3.2 Soils

The U.S. Department of Agriculture, Natural Resources Conservation Service Web Soil Survey was consulted to determine the soil units occurring in the survey area. The *Custom Soil Resource Report for Sacramento County, California – American River Common Features, American River Contract 1: Special-Status Plant Survey* (NRCS, 2019; included as **Appendix B** to this report) shows five map units in the survey area. See Appendix B for a soils map and soil unit descriptions.

3.3 Natural Communities

Natural communities are assemblages of plant species that occur together in the same area, and are defined by species composition and relative abundance. In summer 2018, vegetation was mapped by ESA to an alliance level based on the dominant plant species and in accordance with the membership rules described in the *Manual of California Vegetation* (Sawyer et al. 2009). As described below, these alliances were then grouped into broader natural communities to more closely conform with the CDFW natural communities, which comply with the National Vegetation Classification Standard. **Appendix C** presents a list of plant species observed and **Figures 3a through 3c** depict the natural communities.

California Annual Grassland

Grasslands can be found throughout the survey area, typically in upland areas, and consist mainly of non-native grasses and forbs. Most of the grassland habitat is interspersed amongst woodland and other habitats and present adjacent to urban areas. Annual grasslands on levee slopes are mowed regularly.

Common grass species observed in this community include wild oat (*Avena barbata*), bromes (*Bromus diandrus, B. hordeaceus*), foxtail barley (*Hordeum murinum*), rattail sixweeks grass (*Festuca myuros*), Bermuda grass (*Cynodon dactylon*), and Pacific bentgrass (*Agrostis avenacea*). Pockets of native grasses such as beardless wild rye (*Elymus triticoides*) and purple needle grass (*Stipa pulchra*) occur sporadically throughout the grasslands in the survey area and may have been seeded on the levee slopes.

An assemblage of native and non-native forbs also occurs in these grasslands. Among the many common non-native forbs observed are hairy vetch (*Vicia villosa*), cutleaf geranium (*Geranium dissectum*), Italian thistle (*Carduus pycnocephalus*), yellow star thistle (*Centaurea solstitialis*), prickly lettuce (*Lactuca serriola*), poison hemlock (*Conium maculatum*), wild radish (*Raphanus sativus*), wild mustard (*Hirschfeldia incana*), rose clover (*Trifolium hirtum*), and white sweet clover (*Melilotus indicus*). Some common native forbs observed include Canada horseweed (*Erigeron canadensis*), telegraph weed (*Heterotheca grandiflora*), ragweed (*Ambrosia psilostachya*), elegant clarkia (*Clarkia unguiculata*), and turkey-mullein (*Croton setiger*).

Annual grassland dominated by bromes (CDFW Natural Community Code = 42.026.00) or wild oat (44.150.00) is not considered a sensitive natural community by CDFW (2018b).

Mixed Oak Woodland

Oak woodlands in the survey area are dominated by coast live oak (*Quercus agrifolia*) and valley oak (*Q. lobata*); interior live oak (*Q. wislizeni*) and Northern California black walnut (*Juglans hindsii*) are less frequent contributors to the tree canopy.

Oak woodlands in the survey area support a variety of understory plant species, vegetative structures, and densities. When no shrub layer is present, annual grassland is the dominant understory and includes the common species described above for the California annual grassland community. When a shrub layer is present, common native shrubs observed include California rose (*Rosa californica*), California blackberry (*Rubus ursinus*), blue elderberry (*Sambucus nigra* ssp. *caerulea*), and coyote brush (*Baccharis pilularis* ssp. *consanguinea*). Himalayan blackberry (*Rubus armeniacus*) was the only common non-native shrub observed in the understory of oak woodlands.

Oak woodlands co-dominated by coast live oak and valley oak (71.040.06) are considered a sensitive natural community by CDFW (2018b).

Non-native Woodland

Portions of the survey area are dominated by non-native trees. These single-species tree stands consist of either Australian pine (*Casuarina equisetifolia*), black locust (*Robinia pseudoacacia*), or tree of heaven (*Ailanthus altissima*). With the exception of black locust stands, non-native woodlands in the survey area do not support a shrub understory, and are dominated by the common herbaceous species described above for California annual grassland. Some black locust stands support blue elderberry shrubs in the understory.

Woodlands dominated by non-native trees are not considered a sensitive natural community by CDFW (2018b).

Upland Scrub

Upland scrub habitat in the survey area consists of areas dominated by native and non-native shrubs that have no tree cover and contain the common herbaceous species described above for California annual grassland. The most common native shrub species in this community are coyote brush, California blackberry, and Himalayan blackberry. Other woody species present include blue elderberry, California rose, California grape (*Vitis californica*), and western redbud (*Cercis occidentalis*).

Scrub dominated by coyote brush and blackberry (32.060.15) is not considered a sensitive natural community by CDFW (2018b).

Riparian Scrub

Riparian scrub habitat in the survey area consists of shrub-dominated areas that are subject to hydrologic influence from the Lower American River. These areas are dominated by sandbar willow (*Salix exigua*), arroyo willow (*S. lasiolepis*), common button bush (*Cephalanthus occidentalis*), California rose, California blackberry, California wild grape, blue elderberry, and/or Himalayan blackberry. Areas that experience frequent high flows typically do not support herb species, and cobbles tend to be the dominant ground cover. Areas that experience less frequent, slower flows support a variety of herb species including mugwort (*Artemisia douglasiana*), marsh brittlegrass (*Setaria parviflora*), Santa Barbara sedge (*Carex barbarae*), horsetails (*Equisetum arvense* and *E. hyemale* ssp. *affine*), rushes (*Juncus balticus*, *J. effusus*, and *J. patens*), and beardless wildrye (*Elymus triticoides*).

Riparian scrub dominated by sandbar willow and arroyo willow (61.209.07) is not considered a sensitive natural community by CDFW (2018b). However, riparian areas are potentially subject to the provisions of Section 1600 of the California Fish and Game Code.

Riparian Woodland

Riparian woodlands in the survey area are tree-dominated areas that are subject to hydrologic influence from the Lower American River. These areas are dominated by Fremont cottonwood (*Populus fremontii*), Goodding's willow (*Salix gooddingii*), red willow (*S. laevigata*), white alder (*Alnus rhombifolia*), Oregon ash (*Fraxinus latifolia*), and/or California sycamore (*Platanus racemosa*). Arroyo willow, valley oak, American elm (*Ulmus americana*), and black locust are less frequent contributors to the tree canopy. Riparian woodlands support a variety of shrubs and herbs similar to those described above for the riparian scrub community.

Riparian woodland dominated by Fremont cottonwood and other riparian trees (61.130.00) is considered a sensitive natural community by CDFW (2018b).

Irrigated Turf

The Campus Commons Golf Course and University Park contain irrigated lawns that are mowed regularly and are dominated by Bermuda grass. Irrigated turf is not considered a sensitive natural community.

Riverine

Riverine habitat consists of areas inundated by the Lower American River. Such areas support some submerged or floating aquatic vegetation: Brazilian waterweed (*Egeria densa*), curly pondweed (*Potamogeton crispus*), and water primrose (*Ludwigia hexapetala*). The Lower American River is an aquatic resource subject to Sections 404 and 401 of the Clean Water Act and Section 1600 of the California Fish and Game Code.

Disturbed/Developed

Urban/developed habitat is present in unvegetated portions of the survey area. Paved, gravel, and dirt bike and walking paths and three bridges dissect the survey area. Disturbed/developed habitat is not a sensitive natural community.

CHAPTER 4
Results and Discussion

4.1 Special-Status Plant Species

For the purpose of this report, "special-status plants" include those species, subspecies, and varieties afforded legal protection under the California and/or Federal Endangered Species Acts or that are considered sufficiently rare by the scientific community to potentially qualify for such listing. Special-status plants include plants that fall into one or more of the following categories:

1. Plants listed or proposed for listing as threatened or endangered under the Federal Endangered Species Act (Code of Federal Regulations Title 50, Section 17.12).
2. Plants that are candidates for possible future listing as threatened or endangered under the Federal Endangered Species Act (*Federal Register* Volume 61, No. 40, February 28, 1996).
3. Plants listed or proposed for listing by the State of California as threatened or endangered under the California Endangered Species Act (California Code of Regulations Title 14, Section 670.5).
4. Plants listed as rare or endangered under the California Native Plant Protection Act (California Fish and Game Code, Section 1900 et seq.).
5. Plants that meet the definitions of rare and endangered under the California Environmental Quality Act (CEQA). CEQA Section 15380 provides that a plant or animal species may be treated as "rare or endangered" even if not on one of the official lists (State CEQA Guidelines, Section 15380).
6. Plants considered by the CNPS and CDFW to be "rare, threatened or endangered in California" (CRPR 1A, 1B, and 2 in CNPS, 2019) and CNPS Rank 3 and 4[1] plant species.

4.2 Special-Status Plants in the Study Area

As discussed below, Sanford's arrowhead was observed in the survey area during the ESA special-status plant surveys conducted in July 2019.

[1] CRPR 3 and 4 plants may be analyzed under CEQA Section 15380 if sufficient information is available to assess potential impacts on such plants. Factors such as regional rarity versus statewide rarity should be considered in determining whether cumulative impacts on a CRPR 3 or 4 plant are significant even if individual project impacts are not. CRPR 3 and 4 plants may be considered regionally significant if, for example, the occurrence is located at the periphery of the species' range, or exhibits unusual morphology, or occurs in an unusual habitat/substrate. For these reasons, CRPR 3 and 4 plants should be included in the special-status species analysis. CRPR 3 and 4 plants are also included in the California Natural Diversity Database's Special Plants, Bryophytes, and Lichens List. (See the current online published list at http://www.dfg.ca.gov/biogeodata.)

Sanford's Arrowhead

Description

Sanford's arrowhead (*Sagittaria sanfordii*) (CRPR 1B.2) is an aquatic emergent herb and a member of the Alismataceae family. It grows from a perennial underground tuber. This plant has both aquatic and emergent leaves, each with different morphology. The roots of the *Sagittaria* genus are septate, unlike other Alismataceae genera in California. The species is monoecious, with individuals bearing separate male and female flowers on the same inflorescence. It flowers between May and October. Growth of emergent leaves, and flowering, begins when waters start to recede. Sanford's arrowhead can be distinguished from most other Sagittaria taxa by its linear to lanceolate (non-sagittate) emergent leaves, and by its recurved fruit pedicels. It grows in freshwater ponds, ditches, swamps, and other assorted shallow freshwater habitats from 0 to 650 meters.

Survey Results

Four individual plants determined to potentially be Sanford's arrowhead were observed during the survey on July 9, 2019. The plants were growing within a few square feet of each other in about 4 inches of water, in an area of mud substrate. Observed plant associates include ludwigia (*Ludwigia hexapetala*), whorled marsh pennywort (*Hydrocotyle verticulata*), and water iris (*Iris pseudacorus*). Three of the Sanford's arrowhead plants had only aquatic leaves (**Appendix D,** Photo 1). The fourth plant was just beginning to develop emergent leaves. The emergent leaves were not sufficiently developed to determine whether they would be sagittate. A single root from the largest plant was dug out of the mud and was septate (Appendix D, Photo 2), indicating that the plant was not water plantain (*Alisma* sp.), which looks similar. The plants were located on the left (west) bank of the river at approximately river mile 6, adjacent to Site 2-1.

On July 9, 2019, ESA botanists visited a reference population of Sanford's arrowhead (California Natural Diversity Database Occurrence #97) about 3.3 miles northwest of the survey area. Sanford's arrowhead plants were flowering at the location of the reference population, and were growing in much less water than in the survey area. Also in flower at the location of the reference population was lanceleaf water plantain (*Alisma lanceolatum*), a non-native plant with leaves similar to those of Sanford's arrowhead. When in flower, lanceleaf water plantain and Sanford's arrowhead are obviously different, but when only leaves (aquatic or emergent) are present, they appear similar. The roots of both species at the reference population location were compared to observe septation. Only the Sanford's arrowhead root was clearly septate (Appendix D, Photo 3).

During the first visit by ESA to the survey area, the emergent leaves on the largest plant were not developed enough to determine whether they would be sagittate. Sanford's arrowhead does not have sagittate leaves, unlike most other members of the genus. A follow-up visit was made on July 24, 2019. The largest plant had developed two mature emergent leaves by the time of the follow-up visit (Appendix D, Photos 4 and 5). The emergent leaves were lanceolate, not sagittate. The only other member of the genus in California with lanceolate leaves is *Sagittaria rigida*. All collections of *S. rigida* are either near Point Reyes or north of Red Bluff, far from the survey area. Based on the septate roots, the lanceolate leaves, and the comparison with the reference population, the four plants are most likely *Sagittaria sanfordii* (Sanford's arrowhead).

4.3 Discussion

Based on the appropriate timing of the surveys, above average precipitation during water year 2019, and the presence of target special-status plants in the survey area and at reference sites, no factors known to the investigators have affected the results of the survey. The survey results presented in this report are considered representative of the environmental setting, plant communities, and special-status plant populations in the survey area.

Appendix A
Database Queries

TABLE 1
SPECIAL-STATUS PLANTS WITH POTENTIAL TO OCCUR IN THE STUDY AREA

Scientific and Common Names	Status Federal/State/ CRPR or Other	Habitat Requirements	Potential Occurrence in Study Area
Astragalus tener var. *tener* Ferris' milk-vetch	--/--/1B.1	Vernally mesic meadows and seeps; sub alkaline grasslands. 1-60 meters. April - May	**Low.** Suitable alkaline substrate not present within the Study Area.
Brodiaea rosea subsp. *vallicola* valley brodiaea	--/--/4.2	Silty, sandy and gravelly loam soils; valley and foothill grasslands along swales; vernal pools. 10-335 meters. Grows in grasslands on old alluvial terraces that have developed a perched water table, in vernal pool landscapes (Preston 2013*). April - May (June)	**Low.** Vernal pool landscapes and hydrology not present.
Carex comosa bristly sedge	--/--/2B.1	Coastal prairie; margins of marshes and swamps; valley and foothill grassland. 0-625 meters. May - September	**Moderate.** Suitable habitat present.
Centromadia parryi subsp. *parryi* pappose tarplant	--/--/1B.2	Often on alkaline soils; chaparral; coastal prairie; meadows and seeps; coastal salt marshes and swaps; vernally mesic valley and foothill grassland. 0-420 meters. May - November	**Moderate.** Suitable habitat present.
Centromadia parryi subsp. *rudis* Parry's rough tarplant	--/--/4.2	Valley and foothill grassland on alkaline, vernally mesic soils; seeps; sometimes roadsides; vernal pools. 0-100 meters May - October	**Low.** Suitable soils not present.
Cuscuta obtusiflora var. *glandulosa* Peruvian dodder	--/--/2B.2	Freshwater marshes and swamps. 15-280 meters. July - October	**Low**. Suitable habitat present, but last seen in 1948 in Merced County. Observations in Sacramento County have not yet been verified.
Downingia pusilla dwarf downingia	--/--/2B.2	Mesic valley and foothill grassland; vernal pools; roadside ditches. 1-445 meters. March - May	**Low.** Suitable habitat not present.
Fritillaria agrestis stinkbells	--/--/4.2	Clay or sometimes serpentine soils; chaparral; cismontane woodland; pinyon and juniper woodland; valley foothill grassland. 10-1555 meters. March - June	**Low.** Suitable habitat on suitable soil is not present.
Gratiola heterosepala Boggs Lake hedge-hyssop	--/CE/1B.2	Clay soils; margins of marshes and swamps; vernal pools. 10-2375 meters. April – August	**Low.** Suitable habitat not present.
Hesperevax caulescens	--/--/4.2	Valley and foothill grassland on mesic, clay soils; vernal pools. 0-505 meters.	**Low.** Suitable habitat on suitable soil is not present.

TABLE 3 (CONTINUED)
SPECIAL-STATUS PLANTS WITH POTENTIAL TO OCCUR IN THE STUDY AREA

Scientific and Common Names	Status Federal/State/ CRPR or Other	Habitat Requirements	Potential Occurrence in Study Area
hogwallow starfish		March - June	
Hibiscus lasiocarpos var. *occidentalis* woolly rose-mallow	--/--/1B.2	Often in riprap on sides of levees; freshwater marshes and swamps. 0-120 meters. June - September	**Moderate.** Suitable habitat present.
Juglans hindsii Northern California black walnut		Deciduous tree found in riparian forests and riparian woodlands up to 460 meters. Widely naturalized as a result of agricultural use as a rootstock for English walnuts. Considered native and special-status in stands at three sites. April - May	**Low**. None of the special-status native stands are near the study area.
Juncus leiospermus var. *ahartii* Ahart's dwarf rush	--/--/1B.2	Vernal pools; mesic valley and foothill grassland. 30-229 meters. March - May	**Low.** Study area outside elevation range.
Legenere limosa legenere	--/--/1B.1	Vernal pools. 1-880 meters. April - June	**Low.** Suitable habitat not present.
Lepidium latipes var. *heckardii* Heckard's pepper-grass	--/--/1B.2	Alkaline flats within valley and foothill grassland. 2-200 meters. March - May	**Low.** Suitable soils not present.
Lilaeopsis masonii Mason's lilaeopsis	--/CR/1B.1	Freshwater or brackish marshes and swamps; riparian scrub. 0-10 meters June - September	**Low.** No occurrences this far upriver.
Navarretia eriocephala hoary navarretia	--/--/4.3	Vernally mesic cismontane woodland, and valley and foothill grassland. 105-400 meters. May – June	**Low.** Study area outside elevation range.
Packera layneae Layne's ragwort		Rocky serpentine or gabbroic soils in chaparral and cismontane woodland. 200 - 1,085 meters. April – August	**Low.** Suitable soils not present.
Sagittaria sanfordii Sanford's arrowhead	--/--/1B.2	Assorted shallow freshwater marshes and swamps. 0-650 meters. May – October (November)	**High.** Suitable habitat present and observed recently within 3 miles of study area.
Symphyotrichum lentum Suisun Marsh aster	--/--/1B.2	Brackish and freshwater marshes and swamps. 0-3 meters. (April) May - November	**Low.** Marginal suitable habitat present.
Trifolium hydrophilum saline clover	--/--/1B.2	Marshes and swamps; mesic, alkaline valley and foothill grassland; vernal pools. 0-300 meters April - June	**Low.** Suitable soils not present.

TABLE 3 (CONTINUED)
SPECIAL-STATUS PLANTS WITH POTENTIAL TO OCCUR IN THE STUDY AREA

Scientific and Common Names	Status Federal/State/ CRPR or Other	Habitat Requirements	Potential Occurrence in Study Area

NOTES:

Potential Occurrence in the Project area:
High = The project site and/or immediate project area provide ideal habitat conditions for a particular species and/or known populations occur in the immediate project area or within the project site.
Moderate = The project site and/or immediate project area provides suitable habitat for a particular species.
Low = The project site only provides limited and low quality habitat for a particular species. In addition, the known range for a particular species may be outside of the immediate project area.
Unlikely = The project site does not support suitable habitat for a particular species and/or the project site is outside of the species known range.

Status Codes:

Federal
FE = listed as endangered under the ESA
FT = listed as threatened under the ESA
-– = no listing

State
SE = listed as endangered under CESA
ST = listed as threatened under CESA

California Rare Plant Rank (CRPR)
Rank 1A = Plants presumed extirpated in California and either rare or extinct elsewhere.
Rank 1B = Plants rare, threatened, or endangered in California and elsewhere.
Rank 2A = Plants presumed extirpated in California, but more common elsewhere.
Rank 2B = Plants rare, threatened, or endangered in California, but more common elsewhere.

An extension reflecting the level of threat to each species is appended to each rarity category as follows:
.1 – Seriously endangered in California.
.2 – Fairly endangered in California.
.3 – Not very endangered in California.

SOURCE: USFWS, 2019; CDFW, 2019; and CNPS, 2019.

Project Name: AMERICAN RIVER COMMON FEATURES PROJECT AMERICAN RIVER CONTRACT 1

Subject: List of threatened and endangered species that may occur in your proposed project location, and/or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, under the jurisdiction of the U.S. Fish and Wildlife Service (Service) that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the Service under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

Please follow the link below to see if your proposed project has the potential to affect other species or their habitats under the jurisdiction of the National Marine Fisheries Service:

http://www.nwr.noaa.gov/protected_species/species_list/species_lists.html

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

http://www.fws.gov/endangered/esa-library/pdf/TOC-GLOS.PDF

Please be aware that bald and golden eagles are protected under the Bald and Golden Eagle Protection Act (16 U.S.C. 668 *et seq.*), and projects affecting these species may require development of an eagle conservation plan (http://www.fws.gov/windenergy/eagle_guidance.html). Additionally, wind energy projects should follow the wind energy guidelines (http://www.fws.gov/windenergy/) for minimizing impacts to migratory birds and bats.

Guidance for minimizing impacts to migratory birds for projects including communications towers (e.g., cellular, digital television, radio, and emergency broadcast) can be found at: http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers.htm; http://www.towerkill.com; and http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/comtow.html.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Tracking Number in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

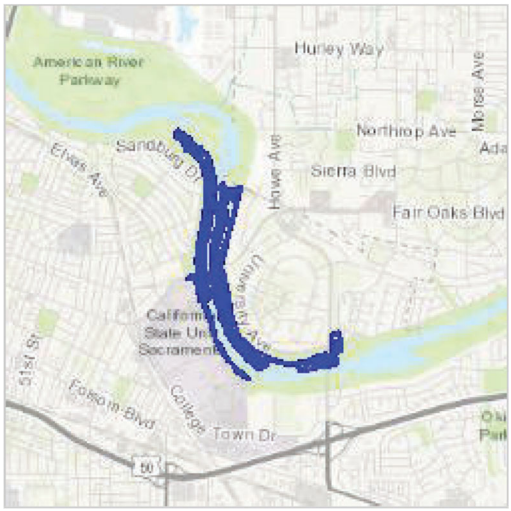
Project Description: levee improvements

Project Location:

Approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/place/38.57036711951812N121.42353694604317W



Counties: Sacramento, CA

Endangered Species Act Species

There is a total of 7 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries[1], as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

August 2, 2019

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Sacramento County, California
Survey Area Data: Version 17, Sep 14, 2018

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Aug 6, 2018—Aug 17, 2018

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
203	Riverwash	15.6	11.6%
205	Rossmoor-Urban land complex, 0 to 2 percent slopes	35.8	26.7%
242	Xerofluvents, 0 to 2 percent slopes, flooded	50.0	37.3%
247	Water	32.7	24.3%
Totals for Area of Interest		**134.1**	**100.0%**

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or

landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Sacramento County, California

203—Riverwash

Map Unit Setting

National map unit symbol: hhpj
Elevation: 20 to 130 feet
Mean annual precipitation: 18 to 20 inches
Mean annual air temperature: 61 degrees F
Frost-free period: 250 to 300 days
Farmland classification: Not prime farmland

Map Unit Composition

Riverwash: 85 percent
Xerofluvents and similar soils: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Riverwash

Setting

Landform: Flood plains
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Gravelly alluvium

Typical profile

H1 - 0 to 60 inches: variable

Properties and qualities

Slope: 0 to 2 percent
Runoff class: Negligible
Depth to water table: About 0 inches
Frequency of flooding: Frequent

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 8w
Hydric soil rating: Yes

Description of Xerofluvents

Setting

Landform: Flood plains
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear

Properties and qualities

Depth to restrictive feature: More than 80 inches
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 7w
Hydric soil rating: No

205—Rossmoor-Urban land complex, 0 to 2 percent slopes

Map Unit Setting

National map unit symbol: hhpl
Elevation: 30 to 110 feet
Mean annual precipitation: 20 inches
Mean annual air temperature: 61 degrees F
Frost-free period: 275 to 300 days
Farmland classification: Not prime farmland

Map Unit Composition

Rossmoor and similar soils: 55 percent
Urban land: 30 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Rossmoor

Setting

Landform: Flood plains
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium

Typical profile

H1 - 0 to 6 inches: fine sandy loam
H2 - 6 to 62 inches: fine sandy loam

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Well drained
Runoff class: Very low
Capacity of the most limiting layer to transmit water (Ksat): High (1.98 to 5.95 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: Rare
Frequency of ponding: None
Available water storage in profile: Moderate (about 7.8 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 3c

Hydrologic Soil Group: A
Hydric soil rating: No

Description of Urban Land

Typical profile
H1 - 0 to 6 inches: variable

Interpretive groups
Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 8
Hydric soil rating: No

Minor Components

Columbia
Percent of map unit: 6 percent
Landform: Flood plains
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Hydric soil rating: Yes

Americanos
Percent of map unit: 5 percent
Hydric soil rating: No

Unnamed, gravelly substratum
Percent of map unit: 2 percent
Hydric soil rating: No

Unnamed, unloamy sandamed
Percent of map unit: 2 percent
Hydric soil rating: No

242—Xerofluvents, 0 to 2 percent slopes, flooded

Map Unit Setting
National map unit symbol: hhqs
Elevation: 20 to 140 feet
Mean annual precipitation: 14 inches
Mean annual air temperature: 61 degrees F
Frost-free period: 250 to 300 days
Farmland classification: Not prime farmland

Map Unit Composition
Xerofluvents and similar soils: 90 percent
Minor components: 10 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Xerofluvents

Setting

Landform: Flood plains
Landform position (two-dimensional): Toeslope
Landform position (three-dimensional): Tread
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Alluvium

Typical profile

H1 - 0 to 60 inches: variable

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Natural drainage class: Somewhat excessively drained
Runoff class: Very low
Depth to water table: More than 80 inches
Frequency of flooding: Occasional
Frequency of ponding: None

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 6w
Hydric soil rating: Yes

Minor Components

Riverwash

Percent of map unit: 4 percent
Landform: Channels
Hydric soil rating: Yes

Rossmoor

Percent of map unit: 3 percent
Hydric soil rating: No

Xerorthents

Percent of map unit: 3 percent
Hydric soil rating: No

247—Water

Map Unit Composition

Water: 100 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Appendix C
Plant Species Observed

TABLE C-1
VASCULAR FLORA RECORDED FROM THE AMERICAN RIVER CONTRACT 1 SURVEY AREA

Scientific Name	Common Name
Adoxaceae	
Sambucus nigra subsp. *caerulea*	blue elderberry
Alismataceae	
Sagittaria sanfordii	Sanford's arrowhead
Amaranthaceae	
Amaranthus albus	tumbleweed
Anacardiaceae	
Pistacia chinensis	*Chinese pistachio*
Apiaceae	
Anthriscus caucalis	bur chervil
Conium maculatum	poison hemlock
Daucus carota	wild carrot
Foeniculum vulgare	fennel
Torilis arvensis	field hedge parsley
Apocynaceae	
Apocynum cannabinum	Indian hemp
Nerium oleander	oleander
Vinca major	bigleaf periwinkle
Araliaceae	
Hedera helix	English ivy
Hydrocotyle verticillata	whorled marsh pennywort
Aristolochiaceae	
Aristolochia californica	California pipe vine
Asteraceae	
Ambrosia psilostachya	ragweed
Anthemis cotula	stinking chamomile
Artemisia douglasiana	California mugwort
Artemisia dracunculus	wild tarragon
Baccharis pilularis subsp. *consanguinea*	Coyote brush
Baccharis salicifolia	mule fat
Bidens frondosa	sticktight
Brickellia californica	California brickellia
Carduus pycnocephalus	Italian thistle
Centaurea solstitialis	yellow star thistle
Centromadia pungens subsp. *pungens*	common tarweed

TABLE C-1
VASCULAR FLORA RECORDED FROM THE AMERICAN RIVER CONTRACT 1 SURVEY AREA

Scientific Name	Common Name
Chondrilla juncea	skeleton weed
Dittrichia graveolens	stinkwort
Erigeron canadensis	Canada horseweed
Asteraceae (cont.)	
Helminthotheca echioides	bristly ox-tongue
Heterotheca grandiflora	telegraph weed
Heterotheca oregana	Oregon golden aster
Lactuca serriola	prickly lettuce
Logfia gallica	narrowleaf cottenrose
Madia elegans	common madia
Pseudognaphalium beneolens	cudweed
Pseudognaphalium luteoalbum	Jersey cudweed
Pseudognaphalium stramineum	cottonbatting plant
Senecio vulgaris	common groundsel
Silybum marianum	milk thistle
Sonchus asper	spiny sowthistle
Sonchus oleraceus	common sow thistle
Taraxacum officinale	common dandelion
Xanthium strumarium	rough cockleburr
Betulaceae	
Alnus rhombifolia	white alder
Betula sp.	birch
Bignoniaceae	
Catalpa bignonioides	Southern catalpa
Brassicaceae	
Brassica nigra	black mustard
Cardamine oligosperma	bitter cress
Hirschfeldia incana	wild mustard
Lepidium didymum	lesser swine cress
Lepidium latifolium	perennial pepperweed
Raphanus sativus	wild radish
Rorippa curvisiliqua	curvepod yellow cress

TABLE C-1
VASCULAR FLORA RECORDED FROM THE AMERICAN RIVER CONTRACT 1 SURVEY AREA

Scientific Name	Common Name
Cannabaceae	
Celtis australis	European hackberry
Caprifoliaceae	
Symphoricarpos albus	Common snowberry
Caryophyllaceae	
Petrorhagia dubia	Windmill pink
Polycarpon tetraphyllum var. *tetraphyllum*	four leaved allseed
Saponaria officinalis	bouncing bet
Spergularia bocconi	Boccone's sand spurry
Spergularia rubra	purple sand spurry
Casuarinaceae	
Casuarina equisetifolia	Australian pine
Chenopodiaceae	
Chenopodium album	lambs quarters
Dysphania ambrosioides	Mexican tea
Salsola tragus	prickly Russian thistle
Convolvulaceae	
Convolvulus arvensis	field bindweed
Cuscuta subinclusa	canyon dodder
Crassulaceae	
Crassula aquatica	water pigmyweed
Cucurbitaceae	
Marah fabacea	California man-root
Cyperaceae	
Carex barbarae	Santa Barbara sedge
Cyperus eragrostis	tall flatsedge
Cyperus esculentus	yellow nutgrass
Isolepis cernua	low bulrush
Equisetaceae	
Equisetum arvense	common horsetail
Equisetum hyemale subsp. *affine*	common scouring rush
Euphorbiaceae	
Croton setiger	turkey-mullein
Euphorbia maculata	spotted spurge
Euphorbia peplus	petty spurge
Triadica sebifera	Chinese tallowtree

TABLE C-1
VASCULAR FLORA RECORDED FROM THE AMERICAN RIVER CONTRACT 1 SURVEY AREA

Scientific Name	Common Name
Fabaceae	
Acmispon americanus	American bird's foot trefoil
Cercis occidentalis	Western redbud
Lathyrus jepsonii var. *californicus*	California tule pea
Medicago polymorpha	bur clover
Melilotus albus	white sweet clover
Melilotus indicus	annual yellow sweet clover
Robinia pseudoacacia	black locust
Sesbania punicea	red sesbania
Trifolium hirtum	rose clover
Trifolium repens	white clover
Vicia villosa	hairy vetch
Fagaceae	
Quercus agrifolia	coast live oak
Quercus chrysolepis	canyon live oak
Quercus ilex	holly oak
Quercus kelloggii	black oak
Quercus lobata	valley oak
Quercus suber	cork oak
Quercus wislizeni	Interior live oak
Gentianaceae	
Zeltnera muehlenbergii	Meuhlenberg's centaury
Geraniaceae	
Erodium botrys	long beaked filaree
Erodium cicutarium	red stemmed filaree
Erodium moschatum	white stemmed filaree
Geranium dissectum	cutleaf geranium
Haloragaceae	
Myriophyllum aquatica	parrot's feather
Hamamelidaceae	
Liquidambar styraciflua	sweetgum
Hydrocharitaceae	
Egeria densa	Brazilian waterweed
Hypericaceae	
Hypericum perforatum	Klamath weed
Iridaceae	
Iris pseudacorus	water iris

TABLE C-1
VASCULAR FLORA RECORDED FROM THE AMERICAN RIVER CONTRACT 1 SURVEY AREA

Scientific Name	Common Name
Juglandaceae	
Juglans californica	Southern California black walnut
Juglans hindsii	Northern California black walnut
Juncaceae	
Juncus balticus	baltic rush
Juncus bufonius	toad rush
Juncus effusus subsp. *pacificus*	Pacific rush
Juncus patens	spreading rush
Lamiaceae	
Marrubium vulgare	white horehound
Mentha pulegium	pennyroyal
Laurceae	
Cinnamomum camphora	Camphor tree
Umbellularia californica	California bay
Lythraceae	
Lythrum hyssopifolia	hyssop loosestrife
Malvaceae	
Malva neglecta	common mallow
Moraceae	
Morus alba	white mulberry
Myrsinaceae	
Lysimachia arvensis	scarlet pimpernel
Myrtaceae	
Eucalyptus camaldulensis	red river gum
Oleaceae	
Fraxinus latifolia	Oregon ash
Fraxinus velutina	Arizona ash
Ligustrum japonicum	Japanese privet
Olea europaea	olive

Standard Assessment Methodology Analysis

APPENDIX C

American River Common Features 2016 American River Contract 1 Standard Assessment Methodology Analysis

Introduction

When the NMFS Biological Opinion (BO) on the American River Common Features (ARCF) 2016 General Reevaluation Report (GRR) was issued on September 15, 2015, specific project designs were not yet developed. Consequently, impacts to relevant fish taxa were analyzed at a feasibility level of design using "reasonable worst-case" parameters using a Standard Assessment Methodology (SAM) analysis (NMFS 2015, p. 174). The BO stated that site-specific SAM analyses would be conducted once site designs were completed, to better evaluate impacts and use SAM results in the negotiation of appropriate mitigation for project actions (NMFS 2015, p. 180).

With the October 2019 completion of 65% designs for the ARCF 2016 American River Contract 1, at the Lower American River (LAR), impacts can be re-analyzed using SAM parameters measured from the site-specific designs. Results of this updated SAM analysis are provided in the Results section below.

The updated SAM analysis was conducted following the same methods as were described in the original NMFS BO (NMFS 2015). The SAM computations were performed using the SAM Electronic Calculation Template Version 4.0 (April 2012), with a few updates made in coordination with NMFS biologists. These updates are described in the Methods section below. This analysis is only conducted on Site 2-1.

Methods

The first update was the inclusion of Winter-run Chinook salmon. Recent research indicates that some juvenile Winter-run Chinook salmon use the Lower American River for non-natal rearing habitat (Phillis et al. 2018). Little information exists about the seasonal timing of this habitat use and the default SAM life-history timing table for Winter-run Chinook salmon in the Lower American River shows no occurrence of any life stage. Consequently, the default SAM life-history timing table for Winter-run Chinook salmon in the section of the Sacramento River that includes the American River confluence (**Figure 1**) was used for this analysis. For all other Evolutionarily Significant Units (ESUs) their default SAM life-history timing tables for the Lower American River were used (Figure 1).

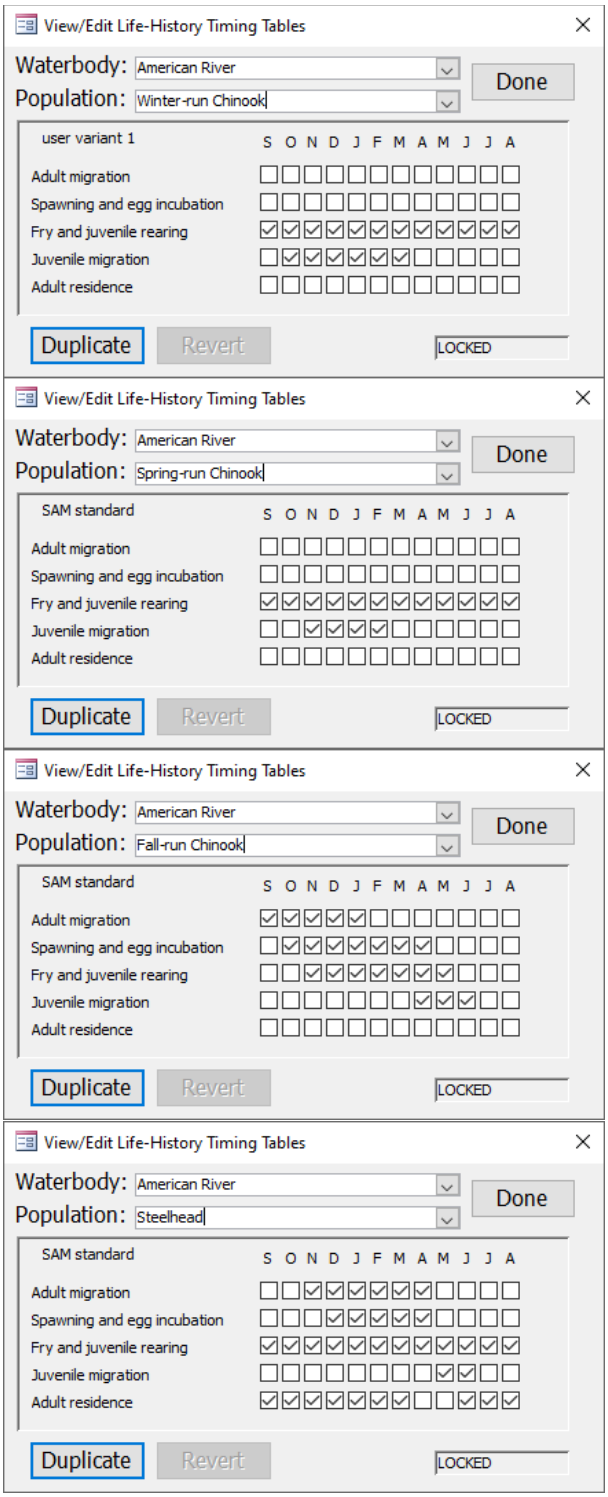

Figure 1. SAM life-history timing tables used in this analysis

The second update was the addition of temporal change (decay) for Instream Structure in both existing and 65% design conditions. Decay of instream structure was estimated using the data compiled in Roni et al. (2015), with a logistic regression used to fit the data and produce estimates of remaining structure at years 0, 1, 5, 15, 25, and 50 (**Table 1**). These estimates were used to scale down the measured values of instream structure shoreline coverage (**Tables 7 and 8**) over time.

TABLE 1
ESTIMATES OF REMAINING INSTREAM STRUCTURE OVER THE 50-YEAR SAM MODELING PERIOD

Year	Percentage of Maximum Instream Structure Shoreline Coverage
0	100%
1	95%
5	90%
15	85%
25	80%
50	48%

Temporal change in the SAM variables Overhanging Shade and Aquatic Vegetation followed the same methods as described in the original NMFS BO, namely use of previous growth models for shade and vegetation in the 65% design condition only (NMFS 2015). Consistent with the original NMFS BO, existing conditions of shade and vegetation were assumed to stay constant for 50 years.

For Overhanging Shade, a botanist determined that the Contract 1 overstory planting designs were reasonably approximated by the Undulating Riparian Bench generalized overstory planting plan (U. S. Army Corps of Engineers [USACE] 2009, Table 3). Consequently, the Undulating Riparian Bench generalized overstory planting plan's shade evolution model (USACE 2009, Table 4f) was applied for the Contract 1 SAM analysis, as shown in **Table 2**.

TABLE 2
ESTIMATES OF GROWTH IN OVERHANGING SHADE OVER THE 50-YEAR SAM MODELING PERIOD

Year	Percentage of Maximum Planted Overhanging Shade Shoreline Coverage			
	Fall	Winter	Spring	Summer
0	0%	1%	2%	0%
1	0%	1%	4%	0%
5	0%	16%	49%	0%
15	100%	25%	75%	100%
25	100%	25%	75%	100%
50	100%	25%	75%	100%

For Aquatic Vegetation, temporal change followed the approach used in the original NMFS BO, as shown in **Table 3**.

TABLE 3
ESTIMATES OF GROWTH IN AQUATIC VEGETATION OVER THE 50-YEAR SAM MODELING PERIOD

Year	Percentage of Maximum Planted Aquatic Vegetation Shoreline Coverage			
	Fall	Winter	Spring	Summer
0	0%	0%	0%	0%
1	10%	25%	50%	50%
5	100%	100%	100%	100%
15	100%	100%	100%	100%
25	100%	100%	100%	100%
50	100%	100%	100%	100%

Measurements

Tables 4 and 5 show the measured values of the SAM variables at existing and 65% design conditions for each Contract 1 site 2-1. Tables 6 and 7 show the values of the SAM variables in the format used for input to the SAM Electronic Calculation Tool (ECT) version 4.0.

TABLE 4
EXISTING CONDITION (2018) MEASUREMENTS OF THE SAM VARIABLES FOR SITE 2-1

	EXISTING CONDITIONS	
	S/F	W/S
Shoreline Length (ft.)	3,403	3,404
Bank Slope (run/rise)	3.6	3.0
Floodplain Area (sq. ft.)	--	814,911
Substrate Size (D_{50}, in.)	3.94	4.50
Instream Structure (ft.)	421	555
Aquatic Vegetation (ft.)	1,219	1,843
Overhanging Shade (ft.)	3,006	3,011

TABLE 5
65% DESIGN CONDITION MEASUREMENTS OF THE SAM VARIABLES FOR SITE 2-1

	65% DESIGN CONDITIONS	
	S/F	W/S
Shoreline Length (ft.)	4,099	4,033
Bank Slope (run/rise)	5.3	8.3
Floodplain Area (sq. ft.)	--	785,618
Substrate Size (D_{50}, in.)	9.90	0.01
Instream Structure (ft.)	1,785	2,011
Aquatic Vegetation (ft.)	2,428	3,283
Overhanging Shade (ft.)	3,814	3,758

TABLE 6
EXISTING CONDITION (2018) MODEL INPUT VALUES OF THE SAM VARIABLES FOR SITE 2-1

	EXISTING CONDITIONS	
	S/F	W/S
Shoreline Length (ft.)	3,403	3,404
Bank Slope (run/rise)	3.6	3.0
Floodplain Area ratio (AQ_2:AQ_{avg})	1.00	1.14
Substrate Size (D_{50}, in.)	3.94	4.50
Instream Structure coverage (%)	12%	16%
Aquatic Vegetation coverage (%)	36%	54%
Overhanging Shade coverage (%)[1]	88%	*22% / 66%*

NOTE:
1 Separate winter and spring values for overhanging shade account for seasonal defoliation/refoliation.

TABLE 7
65% DESIGN CONDITION MODEL INPUT VALUES OF THE SAM VARIABLES FOR SITE 2-1

	65% DESIGN CONDITIONS	
	S/F	W/S
Shoreline Length (ft.)	4,099	4,033
Bank Slope (run/rise)	5.3	8.3
Floodplain Area ratio (AQ_2:AQ_{avg})	1.00	1.25
Substrate Size (D_{50}, in.)	9.90	0.01
Instream Structure coverage (%)	44%	50%
Aquatic Vegetation coverage (%)	59%	81%
Overhanging Shade coverage (%)[1]	93%	*23% / 70%*

NOTE:
1 Separate winter and spring values for overhanging shade account for seasonal defoliation/refoliation.

Results

As described in the original NMFS BO (NMFS 2015, pp. 25-26), SAM results are weighted relative response index (WRI) values that represent the difference between modeled fish response to existing (without-project) and designed (with-project) conditions. Negative WRI values indicate that existing conditions are better for fish and positive WRI values indicate that designed conditions are better for fish. Consistent with the original NMFS BO, WRI values are weighted by shoreline length. Results are presented as WRI values for Site 2-1 project designs in Contract 1.

WRI values do not directly represent actual quantities of river bank, SRA habitat, or riparian habitat, but NMFS has used WRI values as proxies when determining mitigation (NMFS 2015, p. 177). Mitigation for long-term effects is accomplished through on-site mitigation features (e.g., planted vegetation, placed woody material) and, if necessary, purchase of off-site mitigation credits (NMFS 2015, p. 181). If long-term effects do not recover to baseline conditions over the life of a project (50 years) then the purchase of off-site mitigation credits is necessary (NMFS 2015, p. 181). Recovery to baseline conditions and appropriate mitigation was determined by identifying the maximum negative WRI for all salmonid ESUs and evaluating the timeline of that ESU, life stage, and season over 50 years (NMFS 2015, pp. 180-182).

Analysis of Site 2-1

A comprehensive analysis of Site 2-1 was used to assess the effects of American River Contract 1 levee improvements on Site 2-1 on the listed species. This analysis does not allow a comprehensive assessment of the effects of the project on the listed species in the Action Area.

The yearly WRI values are shown in **Figures 2-5** for any life stage that had any negative WRI values. Life stages with exclusively positive WRI values were not plotted, but are included in the summary of maximum WRI values (negative and positive) in **Table 8**. The maximum negative WRI for Spring-run Chinook salmon was -334 (juvenile migration in fall). The maximum negative WRI for Winter-run Chinook salmon was -334 (juvenile migration in fall). The maximum negative WRI for Fall-run Chinook salmon was -163 (juvenile migration in summer). The maximum negative WRI for steelhead was -151 (juvenile rearing in fall). For the SAM-modeled 50-year period, WRI values were predominantly positive and the longest duration of a WRI deficit was 15 years.

TABLE 8
MAXIMUM SAM-MODELED WRI DEFICITS AND BENEFITS FOR SITE 2-1

Noise Modeling Data

Attenuation Calculations for Stationary Noise Sources

KEY: Orange cells are for input.
Grey cells are intermediate calculations performed by the model.
Green cells are data to present in a written analysis (output).

STEP 1: Identify the noise source and enter the reference noise level (dBA and distance).

STEP 2: Select the ground type (hard or soft), and enter the source and receiver heights.

STEP 3: Select the distance to the receiver.

Noise Source/ID	Reference Noise Level			Attenuation Characteristics				Attenuated Noise Level at Receptor		
	noise level (dBA)	@	distance (ft)	Ground Type (soft/hard)	Source Height (ft)	Receiver Height (ft)	Ground Factor	noise level (dBA)	@	distance (ft)
Rip Rap	88.0	@	50	soft	12	5	0.60	88.0	@	50
Rip Rap	88.0	@	50	soft	12	5	0.60	80.2	@	100
Rip Rap	88.0	@	50	soft	12	5	0.60	72.4	@	200
Rip Rap	88.0	@	50.00	soft	12	5	0.60	67.8	@	300
Rip Rap	88.0	@	50	soft	12	5	0.60	64.5	@	400
Rip Rap	88.0	@	50	soft	12	5	0.60	62.0	@	500
Rip Rap	88.0	@	50	soft	12	5	0.60	54.2	@	1000
Rip Rap	88.0	@	50	soft	12	5	0.60	49.6	@	1500
Rip Rap	88.0	@	50	soft	12	5	0.60	46.4	@	2000
Rip Rap	88.0	@	50	soft	12	5	0.60	41.8	@	3000
							0.66			
							0.66			
							0.66			
							0.66			

Notes:

Estimates of attenuated noise levels do not account for reductions from intervening barriers, including walls, trees, vegetation, or structures of any type.

Computation of the attenuated noise level is based on the equation presented on pg. 12-3 and 12-4 of FTA 2006.

Computation of the ground factor is based on the equation presentd in Figure 6-23 on pg. 6-23 of FTA 2006, where the distance of the reference noise leve can be adjusted and the usage factor is not applied (i.e., the usage factor is equal to 1).

Distance Propagation Calculations for Stationary Sources of Ground Vibration

KEY: Orange cells are for input.
Grey cells are intermediate calculations performed by the model.
Green cells are data to present in a written analysis (output).

STEP 1: Determine units in which to perform calculation.

— If vibration decibels (VdB), then use Table A and proceed to Steps 2A and 3A.
— If peak particle velocity (PPV), then use Table B and proceed to Steps 2B and 3B.

STEP 2A: Identify the vibration source and enter the reference vibration level (VdB) and distance.

STEP 3A: Select the distance to the receiver.

Table A. Propagation of vibration decibels (VdB) with distance

Noise Source/ID	Reference Noise Level			Attenuated Noise Level at Receptor		
	vibration level (VdB)	@	distance (ft)	vibration level (VdB)	@	distance (ft)
Haul truck	86	@	25	77.0	@	50

STEP 2B: Identify the vibration source and enter the reference peak particle velocity (PPV) and distance.

STEP 3B: Select the distance to the receiver.

Table B. Propagation of peak particle velocity (PPV) with distance

Noise Source/ID	Reference Noise Level			Attenuated Noise Level at Receptor		
	vibration level (PPV)	@	distance (ft)	vibration level (PPV)	@	distance (ft)
Haul truck	0.076	@	25	0.027	@	50

Notes:

Computation of propagated vibration levels is based on the equations presented on pg. 12-11 of FTA 2006. Estimates of attenuated vibration levels do not account for reductions from intervening underground barriers or other underground structures of any type, or changes in soil type.

Appendix E

Air Quality/Greenhouse Gas Emissions/Health Risk Assessment Modeling Data

Schedule constraints:

1. In-water work window for listed fish species (Aug 1 - Nov 30)
2. Tree removal/elderberry transplant window (Nov 1 - Feb 15)
3. Tree removal in Jan-Feb could be limited/infeasible by high water levels near desired planting bench and toe protection areas

Month	2021 Construction Season Forecast Repair Site 2-1
January	1. Tree removal and pruning (Preferable to do in November/December when flows are likely to be lower?)
February	
March	No activity
April	
May	2. Temporary BMPs, access roads, staging areas, and pedestrian trail reroutes 3. Rock haul from quarry (44,800 CY, 30cy/truck/day for 60 days = 25 trucks) 4. Excavate for buried rock toe and bank protection, prep subgrade (91,700 CY). Export native material (20,300 CY). (188cy/day/excavator @ 60 days = 9 excavators & 18 dump trucks) 5. Import and place filter material (9,600 CY, 188cy/day/excavator @ 60 days = 1 excavator & 6 dump trucks) 6. Place buried launchable rock toe (29,800 CY) and backfill native material (84,000 CY). (188cy/day/excavator @ 50 days = 13 excavators & 26 dump trucks) 7. Bank protection earthwork and bank protection rock (15,000 CY). (188cy/day/excavator @ 60 days = 2 excavators & 4 dump trucks)
June	
July	
August	8. Control of water 9. Rock haul from quarry (102,300 CY, 30cy/truck/day for 60 days = 57 trucks) 10. Excavate and prep subgrade, export native material (26,800 CY) (188cy/day/excavator @ 60 days = 3 excavators & 6 dump trucks) 11. Import and place filter material (22,400 CY, 188cy/day/excavator @ 60 days = 2 excavators & 13 dump trucks) 12. Launchable rock toe excavation and installation (58,300 CY, 188cy/day/excavator @ 60 days = 6 excavators & 12 dump trucks) 13. Bank protection earthwork and bank protection rock (44,000 CY, 188cy/day/excavator @ 60 days = 4 excavators & 8 dump trucks) 14. Import and place planting bench fill (16,000 CY, 100cy/day/excavator @ 50 days = 4 excavators & 8 dump trucks) 15. Import and place Topsoil and Soil Fill and Decomposed Granite (44,000 CY, 100cy/day/excavator @ 60 days = 8 excavators & 16 dump trucks) 16. IWM anchorages, 1 excavator 17. Filter fabric, planting bench earthwork, IWM installation (300 trees)
September	
October	
November	18. Planting bench fine grading 19. Bank protection seeding, erosion control, and winterization
December	Winter/BMP Monitoring
January	
February	
March	
April	
May	
June	GC Closeout
July	20. Irrigation installation 21. Willow poles, and container plants
August	
September

[1]Fugitive Dust PM2.5 was calculated based on a 0.1 ratio of PM2.5/PM10 as indicated in EPA 2006 AP-42 Background Document for Revisions to Fine Fraction Ratios used for AP-42 Fugitive Dust Emission Factors

Assumptions:

1 worker per piece of equipment

10 hours per equipment per day

Average trip length for workers estimated from CalEEMod

		Unit	Source

Equipment List for Mitigation Sites

Glen Hall Site

Number	Equipment	Size	Fuel	Purpose
1	backhoe w/auger	127 hp	diesel	holes for staging area signs
2	chainsaws	64cc/2-stroke	gasoline	fell trees (50)
1	chipper	174 hp	diesel	chip trees
1	excavator	97 hp	diesel	remove stumps (50)
2	string trimmers	35cc	gasoline	trim grasses
1	dozer	474 hp	diesel	rip site 18'' x 7.38 acres
1	backhoe	127 hp	diesel	culti-pack/graded
1	trenching machine	16 hp	gasoline	trenching
1	water pump	5 hp	gasoline	pumping
1	backhoe w/auger	127 hp	diesel	holes for deer fence posts
1	dozer	474 hp	diesel	blading/grading
1	excavator	97 hp	diesel	remove shrubs
1	backhoe	127 hp	diesel	excavate shrub receiving holes (4'x3')
1	Bobcat w/ auger	40 hp	diesel	prepare seedling planting holes

Rio American West Site

Number	Equipment	Size	Fuel	Purpose
1	backhoe w/auger	127 hp	diesel	holes for staging area signs
2	string trimmers	35cc	gasoline	trim grasses
1	dozer	474 hp	diesel	rip site 18'' x 3.38 acres
1	backhoe	127 hp	diesel	culti-pack/graded
1	trenching machine	16 hp	gasoline	trenching
1	portable drill	5.5 hp	gasoline	create hole under bike path
1	water pump	5 hp	gasoline	pumping
1	backhoe w/auger	127 hp	diesel	holes for deer fence posts
1	dozer	474 hp	diesel	blading/grading
1	excavator	97 hp	diesel	remove shrubs
1	backhoe	127 hp	diesel	excavate shrub receiving holes (4'x3')
1	Bobcat w/ auger	40 hp	diesel	prepare seedling planting holes

Rio American East Site

Number	Equipment	Size	Fuel	Purpose
1	backhoe w/auger	127 hp	diesel	holes for staging area signs
2	string trimmers	35cc	gasoline	trim grasses
1	dozer	474 hp	diesel	rip site 18'' x 2.12 acres
1	backhoe	127 hp	diesel	culti-pack/graded
1	trenching machine	16 hp	gasoline	trenching
1	water pump	5 hp	gasoline	pumping
1	backhoe w/auger	127 hp	diesel	holes for deer fence posts
1	dozer	474 hp	diesel	blading/grading
1	excavator	97 hp	diesel	remove shrubs
1	backhoe	127 hp	diesel	excavate shrub receiving holes (4'x3')
1	Bobcat w/ auger	40 hp	diesel	prepare seedling planting holes

[1]Fugitive Dust PM2.5 was calculated based on a 0.1 ratio of PM2.5/PM10 as indicated in EPA 2006 AP-42 Background Document for Revisions to Fine Fraction Ratios used for AP-42 Fugitive Dust Emission Factors

Average trip length for workers estimated from CalEEMod

Mass Conversion Rates	453.59	g/lb	google.com

1200	9999	0.15	2.60	2.60	0.03	0.03	

Note:

1. Tier 4 Emission Factors are converted from EPA Non-road Diesel Engine Standards. Available at www.arb.ca.gov/msprog/ordiesel/documents/Off-Road_Diesel_Stds.xls
2. Assume PM2.5 is 92% of PM10.

Default Horsepower and Load Factor

OFFROAD Equipment Type	Horsepower	Load Factor

Fugitive Dust Emission Factors

1 Aggregate Storage Piles [1]

Emissions result from several distinct processes within the stockpiling cycle: 1. loading in of materials through batch or drop operations, 2. equipment traffic in storage areas, 3. wind erosion of piles, 4. loadout of material through batch or drop operations

E(lb/ton)=(k)(0.0032)(U/5)^1.3/(M/2)^1.4

Where:	**PM10**	Unit	Source
k= Particle Size Multiplier:	0.35	lbs/ton	AP-42 Chapter 13.2.4-3, PM10 emissions
U=mean wind speed	7.1	mph	CalEEMod for Sacramento County
M=moisture content (%)	3.4	constant	AP-42 Chapter 13.2.4-3, Table 13.2.4-1, exposed ground
	0.00084	**lbs/ton**	

2 Travel on Unpaved Roads (Heavy Duty Trucks)[2]

E(lbs/VMT)=(k)(s/12)^a (W/3)^b

Where:	**PM10**	Unit	Source
k= Particle Size Multiplier:	1.5	lbs/VMT	AP-42 Chapter 13.2.2-2, PM10 emissions; industrial roads
s= Silt Content	0.043	constant	AP-42 Chapter 13.2.2-2, service roads
a=	0.9	constant	AP-42 Chapter 13.2.2-2, industrial roads
b=	0.45	constant	AP-42 Chapter 13.2.2-2, industrial roads
W=Vehicle Weight	10	tons	Average weight of loaded and unloaded truck: assumed empty truck weights 2 tons, 10 CY truck capacity and 1 CY of fill equals 1.6 tons ((2+(10cy truck capacity*1.6 tons+2))/2)
	0.02	lbs/VMT	

2a Correction for Natural Precipitation[3]

E(ext)=E[(365-P)/365]

Where:		Unit	Source
P=#days/yr with>=0.01 precip	58	days	CalEEMod for Sacramento County
	0.014	lbs/VMT	

3 Travel on Paved Roads (Heavy Duty Trucks)[4]

E(lbs/VMT)=(k)(sL)^.91 (W)^1.02-C

Where:	**PM10**	Unit	Source
k= Particle Size Multiplier:	0.0022	lbs/VMT	AP-42 Chapter 13.2.1, Table 13.2.1-1, PM10 emissions
sL= road surface silt loading	0.06	g/m^2	AP-42 Chapter 13.2.1, Table 13.2.1-2
C= exhaust, break, tire wear	0.00047	lbs/VMT	AP-42 Chapter 13.2.1, Background Documentation Pg 2-5
W=Vehicle Weight	2.1	tons	Worker Commute Vehicles
W=Vehicle Weight	10	tons	Average weight of loaded and unloaded truck: assumed empty truck weights 2 tons, 10 CY truck capacity and 1 CY of fill equals 1.6 tons ((2+(10cy truck capacity*1.6 tons+2))/2)
	0.002	lbs/VMT	Heavy Duty Haul Trucks
	0.00037	lbs/VMT	Worker Commute Vehicles

3a Correction for Natural Precipitation[5]

E(ext)=E[(1-P/4N)]

Where:		Unit	Source
P=#days/yr with>=0.01 precip	58	days	CalEEMod for Sacramento County
N=# days in aversaging period	365	days	
	0.002	lbs/VMT	Heavy Duty Haul Trucks
	0.0004	lbs/VMT	Worker Commute Vehicles

Worker Commute Vehicle Weight Calculation

Parameters and Calculations for Worker Commute Trips (i.e., passenger vehicles)

			Source
Vehicle class for worker trips	LDA, LDT1, LDT2		default value in CalEEMod's tab for Trips and VMT in the Construction module
Weight	4230	lb	average of vehicle categoriy weight (LDA-3,190 lbs, LDT1-3,750 lbs, LDT2-5,750 lbs) from EMFAC2011
Mass conversion	2000	lb/ton	google.com
Weight	2.12	ton	calculation

4 Bulldozing[6]

Equation is applied to graders and dozers to estimate fugitive dust from grading activity
Emissions factors for P10 from bulldozing are scaled from those of PM15

E(lbs/hr)=C(PM15)*s^1.5/M^1.5
Where
E(PM10)=E(PM15)*F(PM10)

		PM15		
Where:		Unit		Source
C=	coeffiecient	1	constant	AP-42 Table 11.9-1, PM15,overburden
M=	material moisture content	7.9	%	AP-42 Table 11.9-3,Overburden
s=	material silt content	6.9	%	AP-42 Table 11.9-3,Overburden
F=	scaling factor	0.75	constant	AP-42 Table 11.9-1, PM10
		1.00	lbs/hr	
		PM10		
		0.75	lbs/hr

General Conformity Determination

Notice of Availability of Draft General Conformity Determination for American River Watershed Common Features, Water Resources Development Act of 2016 Project (ARCF 2016 Project)

The Clean Air Act (CAA) requires all federal actions to conform to applicable state plans to attain and maintain national air quality standards (i.e., SIP, or State Implementation Plan) (42 U.S.C. 7506(c), section 176(c)). The U.S. Army Corps of Engineers (USACE) prepared a Draft General Conformity Determination for American River Watershed Common Features, Water Resources Development Act of 2016 Project (ARCF 2016 Project), to demonstrate conformity with the California SIP, in accordance with the requirements established by the U.S. Environmental Protection Agency (40 CFR 93.150 *et seq*.)

Project Location: In and around the City of Sacramento, California along the banks of the Sacramento and American Rivers, local tributaries, the associated drainage and levee network, and at the Sacramento Weir and Bypass.

Project Description: Construction of approximately $1.5 billion in structural improvements to the Sacramento metropolitan area flood protection system of levees and bypasses, as recommended in the American River Common Features General Reevaluation Report (ARCF GRR, January 2016). The USACE, Central Valley Flood Protection Board (CVFPB), and Sacramento Area Flood Control Agency (SAFCA) joint Project aims to reduce flood damage and protect public safety within the Greater Sacramento area within the next four to five years. Congress appropriated full funding for the ARCF 2016 Project under the Bipartisan Budget Act (Public Law 115-123). Environmental effects of the levee improvements were analyzed in the Environmental Impact Statement/Environmental Impact Report (ARCF EIS/EIR, January 2016).

The Draft General Conformity Determination provides the opportunity for public and agency involvement and comment. During the 30-day public review period, the USACE encourages public questions and comments on the air quality General Conformity Determination for American River Watershed Common Features, Water Resources Development Act of 2016.

Comments on the Draft General Conformity Determination will be accepted from March 25, 2020 to April 25, 2020. Written comments may be submitted to: *General Conformity Determination ARCF 2016 – Planning Team*, U.S. Army Corps of Engineers, Sacramento District, 1325 J Street, Sacramento, California 95814 or email: spk-pao@usace.army.mil.

The Draft General Conformity Determination is available electronically at sacleveeupgrades.com and the USACE website: http://www.spk.usace.army.mil/Media/USACEProjectPublicNotices.aspx, or the Central Valley Flood Protection Board website: http://www.cvfpb.ca.gov. Copies of the Draft Determination available upon request. Contact our Public Affairs Office at (916) 557-5100, or spk-pao@usace.army.mil.

General Conformity Determination
American River Watershed Common Features 2016 Project

The General Conformity regulations at Title 40 Code of Federal Regulations (CFR) Subchapter C Part 93 ensure that the actions taken by federal agencies do not interfere with a state's plans to attain and maintain national standards for air quality. This General Conformity Determination documents how the American River Common Features (ARCF) 2016 Project will meet the requirements of the General Conformity regulations.

Project Purpose and Description

The purpose of the ARCF 2016 Project is to reduce the risk of flooding within the Greater Sacramento metropolitan area.

The Sacramento metropolitan area is one of the urban regions most at risk of flooding in the United States. Constructed in the mid-twentieth century, the Sacramento River Flood Control Project was designed to protect the city from floodwaters as high as the known flood of record, which at the time of construction was the flood of 1927. A new record flood occurred in 1986, followed by a slightly smaller flood in January 1997, each of which caused levee failures and localized flooding. The primary risks to levee performance are seepage, underseepage, stability, erosion, and overtopping.

High water flows in both the American and Sacramento Rivers place considerable stresses on the network of levees protecting the Sacramento area. Without prompt improvement of weakened or sub-standard levee reaches, the levee system will remain at heightened risk of failure during periods of high water in the two rivers. The consequences of a major levee failure could be catastrophic because the protected area is highly urbanized and flooding could reach 20 feet deep, causing severe property damage, possible loss of life and serious contamination of drinking water supplies for downstream users.

The ARCF 2016 Project will construct approximately $1.5 billion in improvements to the Sacramento metropolitan area flood protection system, as recommended by the *American River Watershed Common Features General Reevaluation Report (GRR)*. Recommendations in the GRR include construction of levee improvement measures to address seepage, instability, erosion, and overtopping risks identified for the Sacramento River, Arcade Creek, Natomas East Main Drainage Canal (NEMDC), and Magpie Creek, as well as erosion control measures for specific locations along the American River, and widening of the Sacramento Weir and Bypass to provide capacity for diversion of a higher volume of flood flows into the Yolo Bypass.

In 2018, under the Bipartisan Budget Act (Public Law 115-123), Congress appropriated full funding for the ARCF 2016 Project under the Long-Term Disaster Recovery Investment Program (LTDRIP). U.S. Army Corps of Engineers (USACE) implementation guidance for the LTDRIP (Civil Works Director's Policy Memorandum # DPM CW 2018-09) requires that the project be implemented on a much accelerated schedule to meet the obligations of the federal funding under this program. To meet the accelerated schedule, this project must be completed by January of 2024. If not completed on this timeline, exposure to significant flood risk persist, including loss of life, loss of agricultural production, damage to homes and businesses, and damage to public facilities.

Regulatory Background

This document pertains only to the federal General Conformity regulations. Applicable state and municipal air quality regulations are discussed in the *American River Watershed Common Features General Reevaluation Report Final Environmental Impact Statement /Environmental Impact Report (December 2015)* and in subsequent project-level reviews.

National Ambient Air Quality Standards

The U.S. Environmental Protection Agency (EPA) develops and enforces federal regulations that govern air quality. The Federal Clean Air Act (CAA) requires EPA to set National Ambient Air Quality Standards (NAAQS) for pollutants considered harmful to public health and the environment. The EPA has identified six "criteria" air pollutants of nationwide concern: ozone, carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), lead, and particulate matter. Particulate matter is further subdivided into particulate with an aerodynamic diameter of 10 micrometers or less (PM_{10}) and particulates with an aerodynamic diameter of 2.5 micrometers or less ($PM_{2.5}$). Ozone is not directly emitted but is instead formed in heat and sunlight from the precursor pollutants of nitrogen oxides (NO_X) and volatile organic compounds (VOC). Although the definition varies slightly, Reactive Organic Gases (ROG) are frequently referred to interchangeably with VOC. SO_2, NO_X, and in some cases VOC and ammonia, are precursor pollutants for the formation of $PM_{2.5}$. Regulatory programs for the control of ozone focus on control of the precursor pollutants. Regulatory programs for the control of $PM_{2.5}$ focus on both direct emissions of $PM_{2.5}$ and precursor pollutants appropriate to the specific nonattainment area.

The CAA identifies two types of national ambient air quality standards. Primary standards provide public health protection, including protecting the health of "sensitive" populations such as asthmatics, children, and the elderly. Secondary standards provide public welfare protection, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings.

EPA designates areas of the State as attainment, nonattainment, maintenance, or unclassified for the various pollutant standards. An "attainment" designation for an area signifies that pollutant concentrations do not exceed the established standard. In contrast to attainment, a "nonattainment" designation indicates that a pollutant concentration has exceeded, and continues to exceed, the established standard. Nonattainment may vary in severity. To identify the severity of the issue and the extent of planning and actions required to meet the standard, nonattainment areas are assigned classifications that are commensurate with the severity of their pollution. Areas that previously exceeded a standard, but have come into compliance, are referred to as maintenance areas. Upon redesignation to maintenance status, an area is required to operate under a maintenance plan which establishes emission reduction measures that will ensure continued compliance with the NAAQS. The maintenance planning period extends for 20 years (two 10-year periods) after the redesignation date. Once the 20-year maintenance planning period is over, the CAA General Conformity Rule no longer applies and the area is considered to be in attainment.

Table 1 shows the NAAQS standards for each of the criteria pollutants. Several NAAQS have been revoked and replaced with more stringent standards over the years. Areas that were in nonattainment of the revoked standards are still subject to requirements to demonstrate compliance, however General Conformity does not apply to revoked NAAQS. Revoked NAAQS are not shown in Table 1.

Under the provisions of the CAA, the EPA requires each state with regions that have not attained the NAAQS to prepare a State Implementation Plan (SIP) detailing how these standards are to be met in each local area. The SIP is a legal agreement between each state and the federal government to commit resources to improving air quality. It serves as the template for conducting regional- and project- level air quality analysis. The SIP is not a single document but a compilation of new and previously submitted attainment plans, maintenance plans, emissions reduction programs, district rules, state regulations, and federal controls. Nonattainment and maintenance areas have a unique geography for each pollutant based on the physical region of the nonattainment area, and the meteorology, sources, and mechanisms that contribute to violations of the NAAQS.

Table 1. National Ambient Air Quality Standards

Pollutant	Averaging Time	Primary Standards	Secondary Standards	Form
Carbon Monoxide (CO)	8-hour 1-hour	9 ppm 35 ppm	—	Not to be exceeded more than once per year
Lead (Pb)	Rolling 3-month average	0.15 µg/m^3	Same as Primary	Not to be exceeded
Nitrogen Dioxide (NO_2)	Annual	53 ppb	Same as Primary	Annual mean
	1-hour	100 ppb	—	98th percentile of 1-hour daily maximum concentrations, averaged over 3 years
Particulate Matter (PM_{10})	24-hour	150 µg/m^3	Same as Primary	Not to be exceeded more than once per year on average over 3 years
Particulate Matter ($PM_{2.5}$)	Annual	12.0 µg/m^3	15.0 µg/m^3	Annual mean, averaged over 3 years
	24-hour	35 µg/m^3	Same as Primary	98th percentile, averaged over 3 years
Ozone (2015)	8-hour	70 ppb	Same as Primary	Annual fourth-highest daily maximum 8-hr concentration, averaged over 3 years
Ozone (2008)	8-hour	75 ppb	Same as Primary	Annual fourth-highest daily maximum 8-hr concentration, averaged over 3 years
Sulfur Dioxide (SO_2)	1-hour	75 ppb	—	99th percentile of 1-hour daily maximum concentrations, averaged over 3 years
	3-hour	—	0.5 ppm	Not to be exceeded more than once per year

Source: EPA 2019. ppm = parts per million; ppb = parts per billion; µg/m^3= micrograms per cubic meter; "—" = no applicable standard.

Attainment Status

Construction of the ARCF 2016 Project currently includes elements in Sacramento and Yolo Counties, and although construction is not currently planned in Solano, Sutter and Placer Counties, minor elements could affect these counties and they are included for completeness. Project emissions will also occur in the San Francisco Bay Area as materials are shipped, by barge, from expected locations adjacent to San Francisco and San Pablo Bays.

Table 2 lists the nonattainment and maintenance areas in the five counties, and their classification. The nonattainment and maintenance areas shown in Table 2 are located within two separate air basins: the Sacramento Valley and the San Francisco Bay Area.

Table 2. Attainment Status for the ARCF 2016 Project Area

Area Name Counties of Interest	**NAAQS** (Specific Standard)	**Status**	**Classification**
Sacramento Metro* Sacramento & Yolo (partial El Dorado, Placer, Solano, & Sutter)	**8-hr Ozone (2008)** 8-hr Ozone (2015)	***Nonattainment*** Nonattainment (recommended)	***Severe-15*** Moderate
Sacramento Sacramento; (partial El Dorado, Placer, Solano, & Yolo)	8-hr CO (2011) **$PM_{2.5}$ (2006)**	Maintenance** ***Nonattainment†***	Moderate Moderate
Sacramento County	PM_{10} (1987)	Maintenance	Moderate
San Francisco Bay Area (partial Solano)	8-Hour Ozone (2008) 8-Hour Ozone (2015) $PM_{2.5}$ (2006)	*Nonattainment* *Nonattainment* *Nonattainment*	Marginal Marginal Moderate
San Francisco-Oakland-San Jose (partial Solano)	8-hr CO (2011)	Maintenance	Moderate
Lake Tahoe North Shore (partial Placer)	8-hr CO (2011)	Maintenance	Not Classified
Sutter Buttes (partial Sutter)	8-hr Ozone (2015)	Nonattainment	Marginal
Yuba City-Marysville (partial Sutter)	$PM_{2.5}$ (2006)	Maintenance	Moderate

Source: EPA 2019, EPA Greenbook, https://www3.epa.gov/airquality/greenbook/anayo_ca.html

*Sacramento Federal Ozone Nonattainment Area (SFONA)

**Sacramento completed its 20 years of maintenance of the CO standard on June 1, 2018.

† USEPA determined Sacramento $PM_{2.5}$ area attained the 2006 24-hr. (2006) NAAQS in May 2017, based on certified 2013-2015 monitoring data. Redesignation Request to be updated and submitted to USEPA.

The boundaries of the nonattainment and maintenance areas designated for implementation of rules and regulations to improve air quality are described in the individual SIPs for the pollutants in question, or are published in the Federal Register at Title 40 CFR, Subchapter C Part 81. The nonattainment and maintenance areas expected to be affected by ARCF 2016 Project emissions are:

- The Sacramento Federal Ozone Nonattainment Area (SFONA) which includes all of Sacramento and Yolo counties and portions of Placer, El Dorado, Solano, and Sutter counties.
- The Sacramento Federal $PM_{2.5}$ Nonattainment Area which is slightly smaller than the ozone nonattainment area and includes all of Sacramento County and portions of Yolo, Solano, Placer and El Dorado counties.
- The Sacramento PM_{10} Maintenance Area which includes all of Sacramento County.
- The San Francisco Bay Area Intrastate Air Quality Control Area (San Francisco AQCA, the 8-hour Ozone and $PM_{2.5}$ nonattainment area) which includes all of Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, and Santa Clara counties and portions of Sonoma and Solano counties.

For the Sacramento Valley Air Basin, the ozone, PM_{10}, and $PM_{2.5}$ nonattainment and maintenance areas have different geographic footprints. For screening purposes, total project emissions for the entire SFONA, which has the largest geographic area, are analyzed and the smaller nonattainment or maintenance area emissions are only considered separately if needed.

General Conformity

The General Conformity process has four main components: an emissions analysis, an applicability determination, mitigation commitments, and an agency and public review. A discussion of each component of the process follows. The General Conformity Determination is the responsibility of the federal agency (USACE for the ARCF 2016 Project) and is subject to review by the air agencies for the local airsheds, the EPA, other agencies, and the public.

Emissions Analysis

An analysis of all direct and indirect emissions associated with the federal action must be completed and compared to *de minimis* thresholds to determine if General Conformity is applicable to the action. For the ARCF 2016 Project, emissions were estimated using the Sacramento Metropolitan Air Quality Management District's (SMAQMD's) *Road Construction Emissions Model* (RCEM), Version 8.1.0. The RCEM was developed by SMAQMD to analyze emissions from linear projects such as roadways, and for the ARCF 2016 Project. Emissions from barges were estimated using the SMAQMD *Harborcraft, Dredge and Barge Emissions Factor Calculator.* The emissions analysis is documented in a memorandum titled *American River Common Features 2016 Air Pollutant Emissions Methods and Results to Support a General Conformity Determination*, which is included in Appendix B to this document. Emission sources analyzed included a wide range of construction equipment and activities, on-road mobile sources (construction material delivery trucks and motor vehicles driven by contractor employees), as well as barge emissions resulting from the delivery of quarry rock and aggregate. The analysis memorandum evaluated two cases to address possible schedule slippage for project elements.

After the memorandum was prepared, USACE updated its anticipated project schedule. Although the component projects, the underlying modeling assumptions, and results did not change, the expected year of construction changed for many of the component projects. Erosion projects which were originally planned to be constructed in multiple years were consolidated into single construction seasons. As a result, the way that the component projects and model results were distributed among calendar years changed. Appendix C to this document contains several tables from the memorandum, updated to reflect USACE's best available schedule assumptions as of March 2020. Emission tables included in this General Conformity Determination document are consistent with these best available schedule assumptions.

The ARCF 2016 Project will be completed through numerous separate contracts over a minimum five-year period. Many elements of the Project are still in the design phase. Consequently, actual emissions will vary from the estimates set forth in this document. Conservative assumptions regarding construction methods and timing were used in the emissions analysis to determine the overall levels of control and mitigation that will be required. Table 3 shows the estimated total uncontrolled (no equipment controls applied; standard vehicle fleet assumptions) project emissions by year in the SFONA and the San Francisco AQCA. See Appendix C for project components and emission summation by year. Only nonattainment and maintenance pollutants are included in Table 3. Uncontrolled SO_2 emissions are estimated to be negligible in both the SFONA and the San Francisco AQCA and therefore are not shown in Table 3.

Table 3. Estimated Uncontrolled Emissions by Year and Control Area

Control Area	**Pollutant Emissions** (tons per year)			
SFONA	**ROG**	**NO_X**	**PM_{10}**	**$PM_{2.5}$**
2019	0.0	0.5	3.3	0.7
2020	3.4	**38.2**	8.3	2.9
2021	4.8	**52.6**	47.1	11.3
2022	7.8	**94.6**	97.2	22.8
2023	5.5	**65.1**	53.4	13.0
San Francisco AQCA	**ROG**	**NO_X**	**PM_{10}**	**$PM_{2.5}$**
2020	0.1	1.3	0.1	0.1
2021	0.5	8.0	0.4	0.3
2022	0.8	13.2	0.6	0.5
2023	1.0	16.8	0.8	0.7

Applicability

The General Conformity Rules established *de minimis* thresholds to screen projects for the potential to impose significant adverse air quality effects. Projects with annual total emissions from direct and indirect emissions less than the *de minimis* thresholds are not considered to be significant and do not require a General Conformity Determination. The *de minimis* thresholds vary based upon the severity of ambient pollution in an area. Table 4 summarizes the *de minimis* thresholds applicable for the ARCF 2016 Project area. Project emissions above these thresholds require a General Conformity Determination to demonstrate how emissions will be controlled and mitigated.

Table 4. General Conformity *De Minimis* Thresholds for the ARCF 2016 Project Area

Control Area	**Pollutant** (NAAQS Standard)	**Classification**	***De Minimis* Threshold** (tons per year)
SFONA	**Ozone (2008)**	**Severe – 15**	**25** (VOC and NO_X)
	PM_{10} (1987)	Maintenance	100
	$PM_{2.5}$ (2006)	Moderate	100 ($PM_{2.5}$, SO_2, and NO_X)
San Francisco AQCA	Ozone (2008)	Marginal	100
	$PM_{2.5}$ (2006)	Moderate	100 ($PM_{2.5}$, SO_2, and NO_X)

Note: VOC and ammonia are not considered precursor pollutants of concern for $PM_{2.5}$ formation in the Sacramento and San Francisco control areas.

Project emissions of criteria pollutants occurring within a nonattainment or maintenance area are compared to the applicable thresholds for that pollutant, as displayed in Table 4 above. A comparison of the estimated uncontrolled ARCF 2016 Project emissions in Table 3 to the General Conformity thresholds in Table 4 shows that uncontrolled project pollutant emissions estimated within the San Francisco AQCA are a minor fraction of the *de minimis* threshold for any pollutant. Within the SFONA, the estimated uncontrolled project emissions of all pollutants except NO_X as an ozone precursor pollutant, are well below the *de minimis* thresholds. Estimated project NO_X emissions are below *de minimis* levels as a $PM_{2.5}$ precursor pollutant.

Uncontrolled project NO_X emissions as a contributor to ozone formation within the SFONA are estimated to be higher than the *de minimis* threshold and therefore a General Conformity Determination is required for NO_X emissions within the SFONA.

Mitigation Commitments

Although General Conformity applies only to emissions over the thresholds, state and municipal air regulations require control of project pollutant emissions, and related reduction and mitigation commitments, as prescribed through the California Environmental Quality Act process. These commitments are discussed in the *American River Watershed Common Features General Reevaluation Report Final Environmental Impact Statement /Environmental Impact Report (December 2015)* and in supplemental documents addressing individual project elements.

Table 5. Estimated Controlled Emissions in the SFONA by Year and Air District

Year	**NO_x Emissions** (tons per year)		
	SFONA	***SMAQMD***	***YSAQMD***
2019	0.5	0.5	--
2020	5.1	5.1	--
2021	15.9	9.9	6.0
2022	**35.3**	30.8	4.5
2023	**30.3**	24.0	6.3

NOTE: Emissions calculations assume on-road equipment fleet achieves overall emissions of 2010 or newer model vehicles and 90% of the on-site equipment meets Tier 4 standards.

Construction of the ARCF 2016 Project will require the use of many pieces of heavy construction equipment. The volume of required equipment can affect the ability of construction and equipment rental companies to provide a low-emitting vehicle fleet. USACE performed outreach to the construction industry to get feedback on the level of emissions control available on the overall construction fleet potentially available to complete the ARCF 2016 Project. Feedback from the construction industry supported USACE's proposal that it is feasible to achieve an equipment fleet for construction of ARCF 2016 with 90 percent of off-road equipment having engines meeting EPA Tier 4 standards. Additionally, USACE has determined that further emission reductions can be achieved by requiring the use of equipment that meets a minimum Tier 1 standard (i.e., no Tier 0 or uncontrolled equipment would be allowed on site, without approval by the Corps. In order to gain approval, contractors must provide updated emissions estimates showing how the Tier 1 standard could be achieved through offsets or additional mitigation implementation).

USACE will first reduce NO_X emissions through specification of an emissions-controlled vehicle fleet, and secondly through obtaining NO_X offsets for any year in which the emissions with implementation of equipment controls exceed the *de minimis* threshold of 25 tons of NO_X emitted within the SFONA boundary. Table 5 shows the estimated NO_X emissions in the SFONA for the ARCF 2016 Project with equipment controls applied, assuming on-road truck emissions will be equivalent to emissions from model year 2010 or newer for the entire on-road truck fleet, and off-road equipment will achieve a fleetwide NO_X reduction equivalent to 90 percent of the emissions reduction if all equipment were equipped with Tier 4 engines.

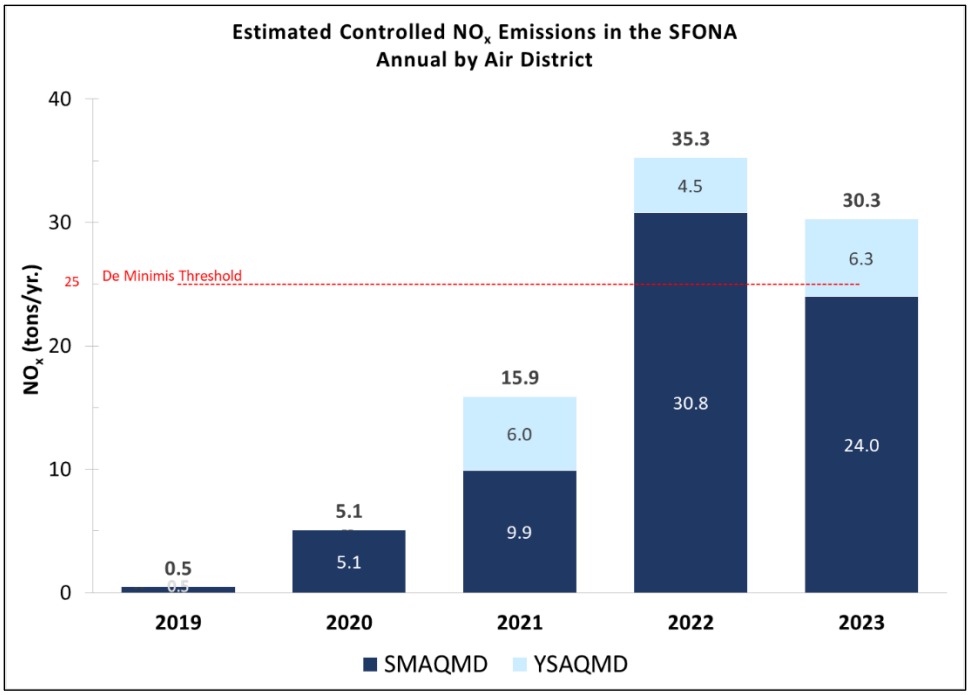

Figure 1. Estimated NO_x emissions in the SFONA Sacramento Metro and Yolo-Solano Air Quality Management Districts.

All direct and indirect emissions occurring within the SFONA must be considered in determining General Conformity applicability. The SFONA overlaps portions of multiple local air quality management districts. Figure 1 and Table 5 show the relative portions of estimated annual SFONA emissions generated in the Sacramento Metro AQMD and Yolo-Solano AQMD by ARCF 2016 Project construction. The Project emissions will primarily be generated from within the SMAQMD. The Sacramento Weir widening and associated levee improvement contracts occur within the Yolo-Solano Air Quality Management District (YSAQMD). No ARCF 2016 Project construction is planned in the higher elevation local air quality jurisdictions. That upper northeastern reach of the SFONA extends into parts of the Placer County Air Pollution Control District, Feather River AQMD, and El Dorado County AQMD.

To mitigate NO_X emissions within the SFONA, USACE will obtain NO_X emissions offsets from the local air quality agencies to fully offset total NO_X emissions – with construction fleet emissions controls applied – in 2022 and 2023. Emission offsets will not be required if emissions can be maintained below 25 tons per year of NO_X in the SFONA through equipment control measures.

Agency Reporting and Public Review

USACE must provide a 30-day notice which describes the proposed action and the Federal agency's Draft General Conformity Determination on the action. USACE must notify the same agencies, planning and land mangers that were notified of the Draft General Conformity Determination within 30 days after making a Final General Conformity Determination. Notice must be given to:

- The EPA Region 9 Office
- State and local air quality agencies
- Any federally-recognized Indian tribal government in the SFONA
- Where applicable, affected Federal land managers
- The agency designated under section 174 of the Act (the California Air Resources Board)
- The Metropolitan Planning Organization

USACE must make public its Draft General Conformity Determination by placing a notice by prominent advertisement in a daily newspaper of general circulation in the area affected by the ARCF 2016 Project and by providing 30 days for written public comment prior to taking any formal action on the draft determination. Following the public comment period on the Draft General Conformity Determination, the USACE must document responses to all comments received. The Final General Conformity Determination must be made public by placing a notice by prominent advertisement in a daily newspaper of general circulation in the area affected by the action within 30 days of the Final General Conformity Determination. Upon request by any person, comments and responses must be made available within 30 days of the Final General Conformity Determination. Both Draft and Final General Conformity Determinations for American River Watershed Common Features 2016 Project will be available on the USACE website for Sacramento Area Levees: sacleveeupgrades.com.

General Conformity Determination

The ARCF 2016 Project will be in conformity with the Clean Air Act and will not cause or contribute to a new violation, nor increase the frequency or severity of existing violations of the NAAQS. The following mitigation measures will be implemented to maintain conformity:

Measure 1: Actual emissions of nonattainment and maintenance pollutants occurring within the SFONA will be tracked monthly using tools acceptable to the SMAQMD and YSAQMD. The tracking data will be used to verify that all pollutants remain below the General Conformity *de minimis* thresholds or are fully mitigated and offset. If actual tracked emissions exceed 25 tons per year NOx, yet the emissions were prospectively estimated at below the *de minimis* threshold, then USACE would obtain offsets and fully mitigate emissions accordingly.

Measure 2: In any calendar year where equipment control measures are projected to be insufficient to maintain project NO_X emissions within the SFONA below the general conformity *de minimis* threshold of 25 tons per year, offsets will be obtained (through purchase or loan) to fully offset the project's total direct and indirect NO_X emissions for that year.

Measure 3 (equipment control measure): USACE will require the use of on-road trucks with 2010 or newer model year engines, or an equivalent emission reduction, in all construction contracts. Construction contracts will allow the use of older model trucks in limited circumstances with a contractor proposed program to reduce vehicle miles travelled and with pre-approved total project emissions estimates for the year.

Measure 4 (equipment control measure): USACE will require the use of Tier 4 emission control technology equivalent to a minimum 90 percent reduction, based on off-road equipment horsepower, relative to the reduction achievable if all equipment used Tier 4 control technology for NO_X emissions from off-road construction equipment. For the remaining 10%, all equipment must meet a minimum Tier 1 standard. No Tier 0 or uncontrolled equipment will be allowed on site, without approval by USACE. In order to gain approval, contractors must provide updated emissions estimates showing how the Tier 1 standard could be achieved through offsets or additional mitigation implementation.

Measure 5: Mitigation offsets will be obtained from SMAQMD to offset NO_X emissions occurring within Sacramento County through the use of Rule 205 Community Bank and Priority Reserve Bank. Mitigation NO_X offsets will be obtained through the normal process described in SMAQMD Rule 205. Specific sections of Rule 205 applicable to meeting the timing requirements of General Conformity Offsets are:

- Section 310 – Community Bank Account Approval Process,
- Section 314 – Reserving Essential Public Services Account Credits,
- Section 405 – Loan Initiation Date, and 500 – Monitoring and Records.

SMAQMD Emission Reduction Credit loan applications must be submitted to the SMAQMD by April 1 of the year prior to emissions being offset, in order to process the transaction and pay all fees prior to January 1 of the following year.

Measure 6: A mitigation offset agreement will be maintained with YSAQMD to offset NO_X emissions occurring within the YSAQMD and the SFONA boundaries. Mitigation NO_X offsets will be purchased as described in the agreement. The NO_X offset agreement for YSAQMD will be similar to the DRAFT *YSAQMD - ARCF 2016 NO_X Offset Agreement* included as Appendix A.

Measure 7: If enough NO_X mitigation offsets are not available from the SMAQMD Community Bank and Priority Reserve, additional offsets will be purchased from the YSAQMD under an agreement (similar to the DRAFT NO_X Offset Agreement in Appendix A) to meet the full offset requirement within the SFONA.

APPENDIX A

DRAFT

YSAQMD – ARCF 2016 NO_X Offset Agreement

NOx Offset Agreement Between Yolo-Solano Air Quality Maintenance District (YSAQMD) and the U.S. Army Corps of Engineers (USACE), Sacramento District

Background

The U.S. Army Corp of Engineers (USACE) is planning to construct a program of improvements to levees in the Sacramento area under the American River Watershed Common Features (ARCF) 2016 Project. The construction program is expected to generate emissions that will exceed the Federal General Conformity thresholds for nitrogen oxides (NO_X) within the Sacramento Federal Ozone Nonattainment Area (SFONA). USACE will mitigate NOx emissions using several measures, including obtaining offsets for NOx emissions within the SFONA. This agreement is a voluntary compliance agreement, as allowed under 40 CFR §93.160 ('Mitigation of Air Quality Impacts'). The General Conformity regulations requires voluntary compliance agreements to contain a description of the proposed mitigation measures, and implementation schedules tied to explicit timelines (see 40 CFR §93.160(a)).

Mitigation Agreement

USACE and YSAQMD agree to the following conditions for obtaining qualifying offsets under General Conformity for NO_X emissions in the SFONA:

1) NO_X emissions generated by the ARCF 2016 Project within the YSAQMD jurisdiction will be offset within the District and the SFONA boundaries. NO_X emissions generated outside of the YSAQMD jurisdictional boundary may also be offset within the YSAQMD boundary with agreement from another local air quality agency with jurisdiction over the emissions and within the SFONA. In accordance with 40 CFR §93.158, the ARCF 2016 Project mitigation measures will "effect emissions reduction equal to or greater than the total of direct and indirect emissions... so that there is no net increase in emissions of that pollutant."
2) YSAQMD manages equipment retirement and replacement programs to achieve NO_X emission reductions within the District. YSAQMD has verified with the U.S. Environmental Protection Agency that equipment replacement programs may accept NO_X mitigation payments from the USACE for mitigation of emissions from construction of the ARCF 2016 project, in conformance with 40 CFR §93.160 and §93.163(a).
    a. Upon receipt by YSAQMD of mitigation payments from USACE, YSAQMD will appropriately offset ARCF 2016 Project emissions with emissions credits generated by equipment under one of YSAQMD's equipment retirement and replacement programs. YSAQMD will take full responsibility for generating offsets that meet the following language of §93.163(a): "the emissions reductions from an offset or mitigation measure used to demonstrate conformity must occur during the same calendar year as the emission increases from the action." USACE shall not be liable for any offset penalty or cost arising from improper use by YSAQMD of mitigation funds received from USACE.
3) USACE agrees to pay a mitigation fee of $18,262 per ton of NO_X offset credits to YSAQMD, plus a ten percent (10%) administration fee on the total mitigation offset charge for NO_X emissions within YSAQMD.
4) Before January 15, 2020 USACE will provide YSAQMD an initial estimate of required offset credits for calendar years 2020, 2021, 2022, and future years if needed, for mitigation of up to 12 tons per year of NO_X (but not to exceed a total of 35 tons NO_X for the entire construction period).

5) USACE will pay YSAQMD in full for offset credits to mitigate for the ARCF 2016 project's NO_X emission offset estimated for calendar years 2022 and 2023 within YSAQMD jurisdiction by February 1, 2022.
6) YSAQMD will procure the offset credits purchased as exclusive to USACE for the applicable calendar years of 2021 through and including 2025. Emission credits will not return to a community bank or be available for use by other projects or persons during the construction period of the ARCF 2016 Project.
7) Any surplus of NO_X emission offset credits (purchased credits in excess of actual emissions) will be held for use in future years for offsetting the emissions from future USACE ARCF 2016 Project contracts.
8) During the period of project construction USACE will provide a calculation of actual emissions within the YSAQMD for each calendar year by February 15 of the following year. USACE will use emission calculation tools required by the Sacramento Metropolitan Air Quality Management District (SMAQMD) for the calculations.
9) USACE will provide a revised estimate of required offsets by 1/15/2023 for calendar year 2023 and future construction years.
10) USACE will pay in full for estimated offsets for calendar year 2023 and future years by 2/1/2023. Future offset payment amounts will be reduced by any surplus purchased offset credits in excess of actual emissions for previous years.

Appendix G

Clean Water Act
Section 404(b)(1) Evaluation

APPENDIX G
Clean Water Act Section 404(b)(1) Evaluation

Introduction

The Sacramento Metropolitan area is one of the most at risk areas for flooding in the United States. There is a high probability that flows in either the American or Sacramento Rivers will stress the network of levees protecting the Sacramento area to the point that levees could fail. The consequences of such a levee failure would be catastrophic since the inundated area is highly urbanized and the flooding could be up to 20 feet deep.

The purpose of the American River Watershed Common Features project (ARCF) is to improve the existing infrastructure to reduce flood risk along the American and Sacramento Rivers. This project covers approximately 22 miles of American River levees, 12 miles of Sacramento River levees, and 5.5 miles of the Natomas Cross Canal levee in Natomas.

The ARCF General Reevaluation Report (GRR) Final Environmental Impact Statement / Environmental Impact Report (EIS/EIR) (U.S. Army Corps of Engineers [USACE] 2016)[1] previously analyzed several alternatives, including a No Action/No Project Alternative and two action alternatives. The Proposed Action, a component of the preferred alternative, includes the installation of erosion protection features along about 1.5 mile of the American River. For a full description of the Proposed Action, see "Alternative 4—Bank Protection-Launchable Rock Trench Combination (Proposed Action)" below.

The Proposed Action would be located in the City of Sacramento and in Sacramento County, California along the descending left bank of the American River, from approximately River Mile (RM) 5.1 at Paradise Beach at Glenn Hall Park upstream to approximately RM 6.6, just upstream of the H Street Bridge. The basic purpose of the Proposed Action is to reduce flood risk to the Riverpark neighborhood and Sacramento. The overall purpose of the proposed action is to improve the existing infrastructure along an approximately 5,500-foot-long reach of the left bank of the Lower American River, to reduce flood risk resulting from erosion.

[1] U.S. Army Corps of Engineers and Central Valley Flood Protection Board. 2016. *American River Watershed General Reevaluation Report, Final Environmental Impact Statement / Environmental Impact Report.* December. Sacramento, California. State Clearing House Number 2005072046.

The basis of this consistency analysis is an evaluation of the consistency of the Proposed Action, and alternatives to the Proposed Action (as described below and in the American River Contract 1 Supplemental Environmental Assessment(EA)/EIR), with the determinations of the 2015 404(b)(1) evaluation and the applicability of the findings of the 2015 404(b)(1) evaluation to the Proposed Action. The source materials are:

- USACE (2015) *Draft Section 404(b)(1) Water Quality Evaluation American River Common Features General Reevaluation Report*. Appendix E in USACE (2016). This Clean Water Act Section 404(b)(1) evaluation first describes the alternatives considered, including the No Action and the Proposed Action. The differences between the alternatives are associated with the type of erosion protection, whether it be through construction of a launchable rock filled trench, bank protection, or a combination of the two. The alternatives description section also provides information on why certain alternatives were not selected, based on impacts to Waters of the U.S. and practicability factors. Lastly, the Proposed Action is compared to the determinations and findings 2015 404(b)(1) to demonstrate how the Proposed Action is consistent with those findings and is the Least Environmentally Damaging Practicable Alternative (LEDPA).

Alternatives

Below are descriptions of the alternatives, including the No Action and Proposed Action. The overall purpose of the proposed action is to improve the existing infrastructure along an approximately 5,500-foot-long reach of the left bank of the Lower American River, to reduce flood risk resulting from erosion (Figure 1). The Proposed Action is specific to the Lower American River; therefore, offsite alternatives were not considered.

Alternative 1—No Action

Under the No Action Alternative, the Proposed Action would not be constructed. As a result, this segment of the levee would remain susceptible to failure because of erosion and would continue to be a weak spot in the system. The levees within the Project Area could fail and result in flooding of the East Sacramento area, leading to catastrophic loss of life and property. This area of Sacramento includes numerous residences and businesses, as well as Sacramento State University, which is located adjacent and immediately to the east of this levee segment. Major government facilities also would be impacted until flood waters recede. Damage to infrastructure, utility systems, and commercial and residential interests would be substantial. Workers would be unable to perform their duties until the buildings are restored and could be occupied. This could cause a temporary shutdown or slowdown of many State and local government functions. Also, there are transportation corridors within the Project Area that could be flooded if levees were to fail.

The Sacramento metropolitan area would continue to be subject to an unacceptably high risk of levee failure and subsequent catastrophic flooding. A flood in the Sacramento metropolitan area would have substantial repercussions that would affect the entire State; the national economy; and Federal, State, and local government operations and infrastructure.

Alternative 2—Launchable Rock Trench

This alternative would entail construction of a launchable rock filled trench, designed to deploy once erosion has removed the bank material beneath it (Figures 2 and 3); rock would also be placed on some areas of the levee slope. The launchable rock trench would be constructed outside of the natural river channel. This location would still be on the water side of the levee at the project site but would be higher on the bank and would not include the lower elevation, in-channel portions of the footprint of Alternatives 3 and 4.

The vegetation would be removed from the footprint of the trench and the levee slope prior to excavation of the trench. All soil removed during trench excavation would be stockpiled for reuse or disposal. The trench configuration would include a (horizontal : vertical) 2H:1V (2:1) landside slope and 1:1 waterside slope and would be excavated at the toe of the existing levee. The bottom of the trench would be constructed close to the summer mean water surface elevation to reduce the rock launching distance and amount of rock required.

SOURCE: NHC, 2020; ESA 2020

ARCF 2016 American River Contract 1

Figure 1
Site 2-1

ESA

After excavation, the trench would be filled with rock that would be imported from an offsite location. The trench would be covered after rock placement with a minimum of three feet of stockpiled soil to allow for planting over the trench. Rock placed on the levee slope would be covered with stockpiled soil. All disturbed areas would be reseeded with native grasses and small shrubs where appropriate. Vegetation would be planted over the trench outside the specified vegetation-free zone required by USACE Engineer Pamphlet (EP) 1110-2-18. This vegetation would likely be limited to native grasses, shrubs, and trees with shallow root systems to ensure that they do not limit the functionality of the trench during a flood event. This vegetation would only be permitted in a way that does not put undue burden on the local maintaining agency and in locations that do not interfere with the conveyance capacity of the channel.

This alternative was not selected because installation of launchable rock trench is not logistically practicable in portions of the project site where the levee is in close proximity to the river channel and insufficient space exists to install launchable rock trench without extensive modification of the levee (i.e., changes to its footprint, profile, or both).

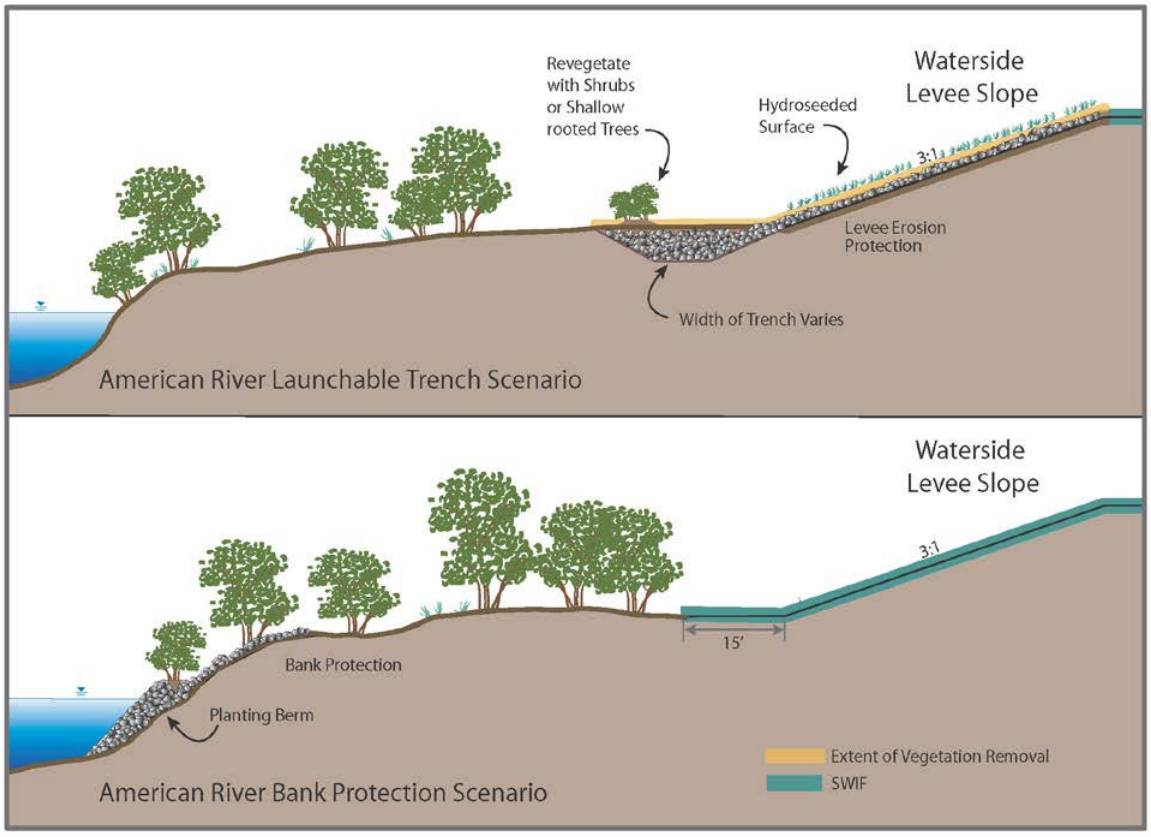

Figure 2
Launchable Rock Trench and Bank Protection Measures

Alternative 3—Bank Protection

This alternative consists of placing rock revetment on the river's bank to prevent erosion (Figures 2 and 4). When necessary, the eroded portion of the bank would be filled and compacted prior to the rock placement. The site would be prepared by clearing and stripping the site prior to construction. Vegetation and loose materials would be removed. Where possible, native trees would remain at these sites. Temporary access ramps would be constructed, if needed, using imported borrow material that would be trucked on site.

Revetment would be imported from an offsite location via haul trucks and temporarily stored at staging areas located in the immediate vicinity of the construction sites. A loader would be used to move revetment from the staging area to a transfer dump truck which would deliver the revetment to areas along the levees where excavators would be moving the material where needed for bank protection. The excavators would place a large rock berm in the water up to an elevation slightly above the mean summer water surface. A planting trench would be established on these rock surfaces for revegetation purposes. The excavators would either be working from the top of the bank placing revetment on the bank beneath it and in the water, or from on top of the rock berm that would previously be established.

The revetment would be placed on the existing bank at a slope varying from a 2:1 to 3:1 slope depending on site-specific conditions along the length of the project site. After revetment placement has been completed, a small planting berm would be constructed in the rock where feasible to allow for some revegetation of the site, outside of the vegetation free zone as required by USACE Engineering Pamphlet (EP) 1110-2-18. This vegetation would be designed on a site-specific basis to minimize the operation and maintenance responsibility of the local maintaining agency and in such a way to not impact the hydraulic conveyance of the channel.

Alternative 3 was not selected because it would result in greater quantities of fill in the active channel of the American River, greater net fill in waters of the U.S., and greater impacts to aquatic resources than Alternative 4 (the Proposed Action). The downstream portion of the project site, from RM 5.1 to RM 5.8 is sufficiently far from the river channel that launchable rock trench can be installed, which would avoid in-channel fill and have no net fill in waters of the U.S. Furthermore, in this portion of the project site, the levee could be protected from erosion with a much shorter length of launchable rock trench than of bank protection because the channel bank is along a river bend and much longer than the adjacent levee, which is relatively straight and located near the base of the bend.

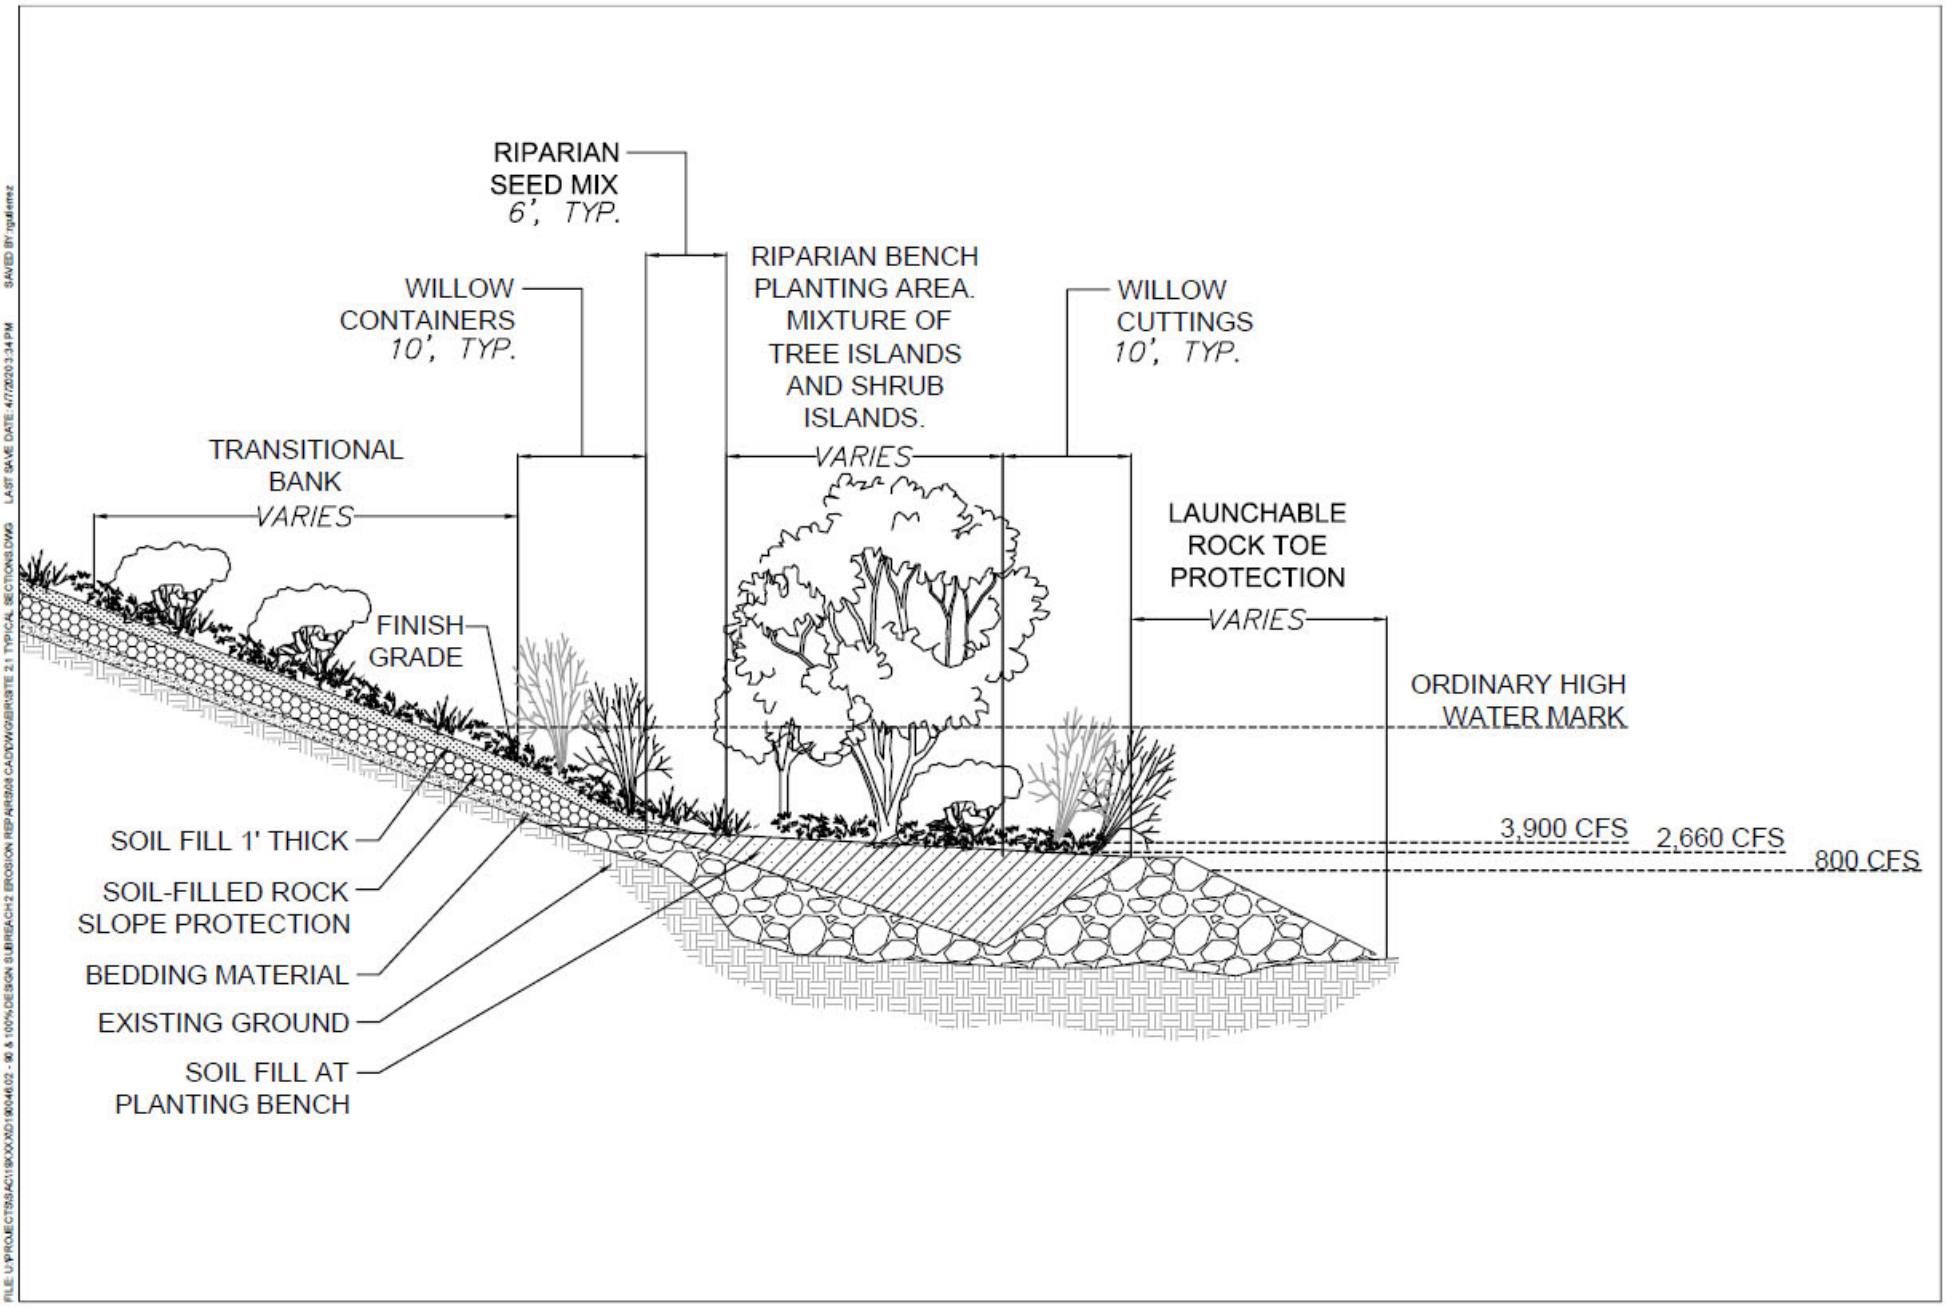
ESA

Figure 3
Launchable Rock Trench Cross Section



ARCF 2016 American River Contract 1

ESA

Figure 4
Planting Bench Cross Section

Alternative 4—Bank Protection-Launchable Rock Trench Combination (Proposed Action)

The Proposed Action would install both launchable rock trench and bank protection at different locations along this segment of levee; rock would also be installed on some areas of levee slope. Bank protection and launchable rock trench would be designed as described for Alternative 2 and Alternative 3, respectively.

Bank protection would be installed from the upstream terminus of Paradise Beach at RM 5.8 to the upstream terminus of the improvements at RM 6.6. Along this section, the levee is very close to the shoreline, and consequently a launchable rock trench is not practicable here. Therefore, erosion protection in this section would consist of riprap (large angular rocks) placed as bank protection along the waterside slope of the levee that would transition downward into planting benches along the shoreline, which would be supported by a submerged launchable riprap toe. The riprap would augment existing bank protection along the levee.

Launchable rock trench would be installed from Glenn Hall Park at RM 5.1 to the upstream end of Paradise Beach at RM 5.8. Along this section, the levee is setback a considerable distance from the shoreline. Therefore, erosion protection in this section would consist of riprap along the waterside levee slope extending and connecting to a buried launchable rock trench (i.e., a trench filled with riprap), which would be outside of the active channel and at a considerable distance from the active shoreline.

Rock slope protection has been designed to provide roughness to the levee to withstand modeled shear stresses of the design flow magnitude. The minimum required toe protection below the planting bench is 5-feet thick with Class C quarry stone (18 – 36 inches large). Soil filled quarry stone will be used on the levee slope above the planting bench. Rock sizing and layer thickness are based on Engineer Manual (EM) 1110-2-1601. Up to 179,100 cubic yards (cy) of quarry stone will be needed for the Proposed Action. The material would be imported from a licensed, permitted facility that meets all Federal and State standards and requirements. The material would be transported to the project site via trucks.

During development of the detailed design of the Proposed Action, appropriate and practicable steps to minimize potential adverse effects of discharge and fill on the aquatic ecosystem were taken including confining fill to the smallest practicable area. This was done by conducting an erosion assessment that identified the areas most in need of protection and only those areas would be treated. A hydraulic model was used to determine the minimum required rock protection of the site to avoid mobilizing the material. Also, the areas disturbed by construction would be returned as close as possible to pre-project conditions where practicable.

A combination of measures would be used to reduce impacts to water quality. The use of the quarry stone bank protection will allow for sediment traveling downstream to get trapped in the spaces between. The planting bench incorporated into the levee design will be planted with native vegetation like willows and cottonwood and in-stream woody material will aid in shading the water for temperature control and as fish habitat enhancement.

The design of the Proposed Action was prepared to: (1) minimize impacts on hydraulic capacity and fisheries; (2) maximize the width of the planting benches without impacting hydraulic capacity; (3) minimize excavation into the existing berm and preserving existing resources where possible; and, (4) minimize the footprint into the existing channel.

This alternative was selected as the LEDPA as it meets the basic and overall purpose by reducing flood risk resulting from erosion; it is practicable (compared to Alternative 2); results in the least amount of impacts to Waters of the U.S. (compared to Alternative 3); and consistent with the 2015 404(b)(1) analysis (see "Comparisons" section below).

Other Alternatives Not Considered

Other alternatives that were not considered include smaller bank protection footprints to minimize impacts to existing vegetation and the use of bioengineered techniques for protecting banks. As stated above, this activity is site specific because the erosion control is targeted for this specific erosion site and the other alternatives did not meet the needs for this site.

Reducing the footprint is not possible because the extent of this individual erosion site and the need to withstand 200-year flood events and tie in with adjacent levee protection work. The height of the levee improvements was determined adequate to withstand modeled shear stresses of the design flow magnitude.

Bioengineered techniques are not sufficient to provide the bank protection required due to the high velocities in the river at flood stage. The bank protection is engineered for a 200-year flood event and bioengineered materials would not provide adequate bank protection during a 200-year event at the project site.

Comparisons

This section contains an evaluation of the potential short-term or long-term effects of the Proposed Action and a conclusion regarding the consistency of these effects of the Proposed Action with the 2015 404(b)(1) evaluation. Actions to minimize effects and secondary effects are included in the discussions.

Physical Substrate

Existing Substrate and Fill

The Proposed Action would create a permanent change of substrate on the riverbanks from alluvial soils to stone riprap. However, the rock berms would be covered with a silty or sandy layer of soil to allow for the planting of vegetation along the river banks. This silty or sandy layer of soil would be from on-site or of a similar substrate type to the existing condition.

Fill material for protecting the waterside levee slope would consist of a mix of 70% rock and 30% soil covered by topsoil or aggregate (at existing trails/roads). The rock would be large stone riprap ranging from 8 to 36-inch diameter. Soil and fill would come from on-site or from clean, imported fill material. Rock would be imported. Imported fill material would be from either a tested and approved borrow site, or from a commercial source. *This is consistent with the 2015 404(b)(1) evaluation.*

Changes to Disposal Area Elevation

The Proposed Action would place rock on the river's banks and on bench slopes. This fill would vary in thickness. The riprap bank protection along levee slopes would be a minimum of 2-foot thick layer composed of a mix of 70% rock and 30% soil to promote vegetation establishment and would be covered with a one-foot layer of topsoil or with an aggregate base where there are existing roads. At the lower part of the bank slope where the launchable toe and planting bench are located, the thickness would be about 5 feet thick or thicker. *This is substantially consistent with the 2015 404(b)(1) evaluation.*

Duration and Extent of Substrate Change

The Proposed Action would create an effectively permanent change of substrate on the riverbanks from alluvial soils to stone riprap covered with a silty or sandy layer of soil from on-site or of a similar substrate type to the existing condition. A typical bank protection site has an approximate life span of 50 years. *This is consistent with the 2015 404(b)(1) evaluation.*

Migration of Fill

The Proposed Action is designed to avoid significant migration of newly placed fill through the use of geotextiles and the establishment of on-site vegetation. However,

during the life span of the bank protection, there would be natural erosion and migration of fill occurring at the project site, but at a slower rate than without bank protection. Also, continued bank erosion would lead to the movement of revetment from the launchable toe of bank protection or from the launchable rock trench onto the lower bank and adjacent channel bed. This would be a localized, rare event, but is likely to occur during the next 50 years. The Proposed Action's erosion protection measures are likely to somewhat reduce the sediment supply for riverine reaches directly downstream because the riprap would hold the bank or levee in place. However, from a system sediment perspective, the bank material that would be protected in the project reaches is not a major source of sediment on the American River. *This is consistent with the 2015 404(b)(1) evaluation.*

Changes to Environmental Quality and Value

Potential impacts to environmental quality and value include a potential temporary increase in turbidity during bank protection construction, runoff of exposed soils, and cement, slurry, or fuel spills during construction. Emissions from construction equipment, haul trucks, and barges also pose a potential impact to environmental quality and value during the duration of construction activities. Best management practices (BMPs) and measures incorporated from the GRR EIS/EIR, with clarifying modifications, would be implemented during construction. There would be a permanent change in substrate in the footprint of the placement area. However, these sites would be designed to be as consistent as feasible with natural riverbanks through the placement of silt over the rock layer and the planting of on-site shrubby vegetation and native grasses. To the extent feasible, large trees on the lower waterside slope would be left in place to maintain shaded riverine aquatic habitat for special status fish species. *This is consistent with the 2015 404(b)(1) evaluation.*

The Proposed Action would implement BMPs and incorporate the measures from the GRR EIS/EIR, with clarifying modifications. These BMPs and measures include:

- Implementing Sacramento Metropolitan Air Quality Management District's (SMAQMD's) Basic Construction Emission Control Practices and other BMPs to control fugitive dust, runoff, and emissions.

- Implementing enhanced fugitive dust control practices and enhanced on-site exhaust controls in addition to SMAQMD's Basic Construction Emission Control Practices and other BMPs

- Implementing a Storm Water Pollution Prevention Plan (SWPPP), Spill Prevention Control and Countermeasures Plan, and associated BMPs.

- Conducting earthwork during low flow periods (generally May 1 through November 30).

- To the extent possible, staging construction equipment and materials on the landside of the subject levee reaches in areas that have already been disturbed.

- Minimizing ground and vegetation disturbance during project construction by establishing designated equipment staging areas, ingress and egress corridors, spoils disposal and soil stockpile areas, and equipment exclusion zones prior to the commencement of any grading operations.

- Stockpiling soil on the landside of the levee reaches, and install sediment barriers (e.g., silt fences, fiber rolls, and straw bales) around the base of stockpiles to intercept runoff and sediment during storm events. If necessary, cover stockpiles with geotextile fabric to provide further protection against wind and water erosion.

- Installing sediment barriers on graded or otherwise disturbed slopes as needed to prevent sediment from leaving the project site and entering nearby surface waters.

- Installing plant materials to stabilize cut and fill slopes and other disturbed areas once construction is complete. Plant materials could include an erosion control seed mixture or shrub and tree container stock. Temporary structural BMPs, such as sediment barriers, erosion control blankets, mulch, and mulch tackifier, would be installed as needed to stabilize disturbed areas until vegetation becomes established.

- Conducting water quality tests specifically for increases in turbidity and sedimentation caused by construction activities.

This is consistent with the 2015 404(b)(1) evaluation.

Water Circulation, Fluctuation, and Salinity

Because the Proposed Action consists of erosion protection measures that are fix-in-place levee improvements, its implementation would have no effect on current patterns and water circulation. *This is consistent with the 2015 404(b)(1) evaluation.*

Because the American River system is regulated by upstream dams that allow a specific amount of water to be released into system, the Proposed Action would not change water level fluctuation patterns. *This is consistent with the 2015 404(b)(1) evaluation.*

Because the project site is located in a freshwater riverine system, the Proposed Project would not alter salinity gradients. *This is consistent with the 2015 404(b)(1) evaluation.*

Water Quality

Water Chemistry

The Project Area is in the Sacramento Hydrologic Basin Planning Area and Lower American Hydrologic Subarea, as designated by the Central Valley Regional Water Quality Control Board (RWQCB). Water quality standards for this basin are contained in

the Water Quality Control Plan for the Sacramento River Basin and the San Joaquin River Basin (Basin Plan) per Section 303 of the Clean Water Act.

The Basin Plan objective for pH is between 6.5 and 8.5, and discharges cannot result in changes of pH that exceed 0.5. The proposed construction materials (rock and sand or silt soil) have little potential to affect the pH of the American River, and the proposed action.

The Lower American River is listed as impaired for chlorodane, dichlorodiphenyltrichlorothane (DDT), diazinon, dieldrin, mercury, polychlorinated biphenyls (PCBs), and an unknown toxicity.[2] However, the Proposed Action would not involve use of materials containing significant amounts of PCBs, mercury, or pesticides. (Diazinon, dieldrin, chlorodane, and DDT are pesticides.)

Construction of the Proposed Action would include ground disturbance activities that could expose soils to increased rates of erosion during storm events that could increase the rate of sedimentation in receiving waters. Sediment input into the river and turbidity caused by sediment-laden runoff or placement of rock in the river could cause a turbidity plume in the water that could exceed the Basin Plan objective for turbidity in the American River (10 nephelometric turbidity units [NTUs], except during periods of storm runoff). Also use and storage of equipment could result in the accidental spills of fuel, oil, and other construction equipment related materials that could also be carried in stormwater runoff to receiving waters. As a result, there is the potential for construction activities to adversely affect receiving water chemistry.

Construction contractors would be required to prepare and implement a SWPPP and comply with the conditions of the National Pollutant Discharge Elimination System (NPDES) general stormwater permit for construction activity. The contractor would be required to obtain a permit from the Central Valley RWQCB detailing a plan to control any spills that could occur during construction. The plan would describe the construction activities to be conducted, BMPs that would be implemented to prevent discharges of contaminated stormwater into waterways, and inspection and monitoring activities that would be conducted. These avoidance and minimization measures would reduce effects on water chemistry and ensure that the Proposed Action would not violate State water quality standards identified in the Basin Plan or the Toxic Effluent Standards of Section 307 of the Clean Water Act. *This is consistent with the 2015 404(b)(1) evaluation.*

Clarity

Placement of fill materials would temporarily reduce clarity due to an increase in total suspended solids within the Project Area. Clarity is not expected to be substantially affected outside the immediate Project Area. However, the reduction of clarity caused by

[2] State Water Resources Control Board. 2010. *303(d) List of Impaired Waters*. https://www.waterboards.ca.gov/centralvalley/water_issues/tmdl/impaired_waters_list/#intrpt2018. Accessed December 2019.

construction activities would be short in duration and would return to pre-construction levels upon project completion. *This is consistent with the 2015 404(b)(1) evaluation.*

Color

The Proposed Action is expected to affect color only during fill activities. Placement of fill materials would temporarily induce a color change due to an increase in turbidity. These effects would be consistent with those discussed above for clarity. The change in color caused by construction activities would be short in duration and would return to pre-construction levels upon project completion. *This is consistent with the 2015 404(b)(1) evaluation.*

Odor

The Proposed Action would not result in any major sources of odor, and would not involve operation of any of the common types of facilities that are known to produce odors in water (e.g., wastewater treatment facility). Air-borne odors associated with diesel exhaust emissions from the use of onsite construction equipment may be noticeable from time to time by adjacent receptors. However, the odors would be intermittent and temporary, would dissipate rapidly from the source with an increase in distance, and are unlikely to affect water odor. Furthermore, as required by California Air Resources Board (CARB) regulation 13 CCR 2449(d)(3), no in-use off-road diesel vehicles may idle for more than 5 consecutive minutes. In addition, implementation of mitigation measures, which are required to reduce other air quality effects, would further reduce exhaust emissions and provide advanced notification of construction activity. *This is consistent with the 2015 404(b)(1) evaluation.*

Taste

The proposed materials and construction activities are not expected to affect taste. *This is consistent with the 2015 404(b)(1) evaluation.*

Dissolved gases

The proposed materials and construction activities are not expected to directly affect dissolved gases. However, to the extent that the Proposed Action results in a temporary increase in water temperature at the project site, the concentration of dissolved gases would be reduced. The potential effects on water temperature are described in the following section. *This is consistent with the 2015 404(b)(1) evaluation.*

Temperature

The Proposed Action's construction activities have the potential to affect water temperatures by creating substantial turbidity and by removing many trees along the lower waterside slope. The project includes measures to control turbidity, in particular the preparation and implementation of a SWPPP, installation of a turbidity curtain and/or

other control measures approved by the National Marine Fisheries Service (NMFS), and so the effect of turbidity on water temperature would be minimized. Also, the Proposed Action's design includes a berm on which trees and shrubs would be planted and that in the long term would provide shade and result in a beneficial effect on water temperatures. Nonetheless, in the short term the Proposed Action could impact (increase) water temperatures. This effect would be mitigated by installing offsite compensatory shaded riverine aquatic (SRA) habitat. *This is consistent with the 2015 404(b)(1) evaluation.*

Nutrients

The Proposed Action's construction activities have the potential to affect nutrient levels during construction and in the long term. Release of suspended sediments during construction could potentially cause thresholds for nutrients to be exceeded. However, the construction contractor would implement a SWPPP including BMPs that would prevent release of excess nutrients during construction. Long-term nutrient levels would not be substantially altered by the Proposed Action because its design includes a berm on which trees and shrubs would be planted and at maturity would provide nutrient inputs comparable to the existing shaded riverine aquatic corridor on the project site. In addition, nutrients from the upstream watershed would remain in the system. *This is consistent with the 2015 404(b)(1) evaluation.*

Eutrophication

The Proposed Action is not expected to contribute excess nutrients into the stream or promote excessive plant growth during construction or in the long-term. Also, a SWPPP would be prepared and implemented with BMPs that would prevent release of excessive nutrients during construction. Post-construction, surfaces would be revegetated, which would limit nutrient inputs (e.g., from overland flow), and nutrient inputs from overland or subsurface flow would be further limited by the high content of rock in the fill material. *This is consistent with the 2015 404(b)(1) evaluation.*

Suspended Particulates/Turbidity

The Proposed Action would alter suspended particulate type and concentration or turbidity by:

- Placement of riprap, which would temporarily generate increased turbidity in the immediate vicinity, and could result in a sediment plume affecting areas further downstream.

- Stormwater runoff from landside construction areas affecting turbidity.

Placement of riprap in the water could result in a sediment plume, generated from the channel bottom and levee side, becoming suspended in the water and could generate turbidity levels above those identified as acceptable by the Basin Plan. As rock riprap is placed in the open water, significant indirect effects could result as a turbidity plume

drifts further downstream and later affects water qualify in downstream areas. To reduce these to a less-than-significant level, the construction contractor would prepare and implement a SWPPP, and would install, prior to in-water work, a turbidity curtain or other comparable minimization measure. (See also "Actions to Minimize Effects" below.) *This is consistent with the 2015 404(b)(1) evaluation.*

To minimize impacts to water quality, including turbidity, the construction contractor would prepare and implement a SWPPP and comply with the conditions of the National Pollution Discharge Elimination System (NPDES) Construction General Permit. Also, a turbidity curtain or other comparable minimization measures approved by NMFS and the U.S. Fish and Wildlife Service (USFWS) would be installed prior to any in-water work conducted on the waterside of the levee. The SWPPP would describe the construction activities to be conducted, and BMPs that would be implemented to contain spills and prevent discharges of stormwater into waterways. BMPs could include but are not limited to straw waddles, geotextile and coir mats, tire wash stations at ingress/egress points to prevent tracking soil offsite onto roadways and entering the municipal stormwater collection system, and sand filter bags at stormwater collection inverts. Potential turbidity effects from landside construction (e.g., vehicle, staging, placement of construction equipment) would be limited to stormwater runoff carrying loose soil from staging areas and construction vehicle access areas. Following construction of the levee repairs BMPs would continue to be monitored and implemented while vegetation matures enough to stabilize surface soil in the Project Area. Further, the installed bank protection would include plantings of riparian vegetation that could slow flows down and reduce turbidity during flood flows. *This is consistent with the 2015 404(b)(1) evaluation.*

Contaminants

The Proposed Action's construction activities would involve the use of potentially hazardous material, such as fuels, oils and lubricants, and cleaners, which are commonly used in construction projects. Also, although the five hazardous waste/materials sites identified in the study area of the GRR are not in the Project Area, and no sites in the Project Area were identified through a November 2019 review of the Department of Toxic Substances Control Envirostor database and State Water Resources Control Board Geotracker,[3,4] contaminants could already be present at the construction site.

To minimize the impacts associated with contaminants, the Proposed Action would incorporate the following measures described in the GRR EIS/EIR.

- Construction contractors would be required to use, store, and transport hazardous materials in compliance with Federal, State, and local regulations during project construction and operation.

[3] Department of Toxic Substances Control, 2019. Available: https://www.envirostor.dtsc.ca.gov/public/map/?global_id=CAT080031115. Accessed November 21, 2019 and December 13, 2019.

[4] State Water Resources Control Board. 2019. Geotracker Available: https://geotracker.waterboards.ca.gov/map/?CMD=runreport&myaddress=sacramento. Accessed November 21, 2019 and December 13, 2019.

- Testing of borrow sites would occur prior to the use of material and sites which have contaminated soils would not be used for this project.

- Any hazardous substance encountered during construction would be removed and properly disposed of by a licensed contractor in accordance with Federal, State, and local regulations.

- The risk of significant hazards associated with the transport, use, and disposal of these materials is low, and compliance with applicable regulations would reduce the potential for accidental release of hazardous materials during transport and construction activities.

- Project areas would be tested contaminants prior to construction, and any materials found would be disposed of in accordance with all Federal, State, and local regulations at an approved disposal site.

- The contractor would be required to prepare a SWPPP and a Spill Prevention Control and Countermeasures Plan (SPCCP), which detail the contractor's plans, including BMPs, to prevent discharges from the construction site into drainage systems, lakes, or rivers.

This is consistent with the 2015 404(b)(1) evaluation.

Aquatic Ecosystems and Organisms

Plankton

Plankton are drifting plant and animal organisms that inhabit the pelagic zone of oceans, seas, or bodies of fresh water, including the Lower American River at the project site. Because project construction activities would affect turbidity, incident radiation, water temperature, and inputs of organic matter from bank vegetation at the project site, the Proposed Action would affect plankton as they passed through this area in the flowing water of the Lower American River. Because project effects on turbidity, water temperature, and incident radiation would be local, temporary, and minimized to less-than-significant levels, and because most plankton would only be transiently present at the project site, effects on plankton would be less than significant. (See also the preceding sections "Water Quality" and "Suspended Particulates/Turbidity.") *This is consistent with the 2015 404(b)(1) evaluation.*

Benthos

The American River at the project site has a sandy/silty bottom and natural banks, which have benthic macroinvertebrates. Disturbance during construction and placement of revetment on banks and the immediately adjoining channel bed will cause temporary impacts to benthic organisms. But following construction, the rock berm would be covered with a silty soil layer, and native benthic organisms would be expected to

recolonize the area. After the project is complete, the spaces between the quarry stone will capture sediment traveling downstream, providing benthic surfaces similar to existing conditions, which benthic organisms would be expected to recolonize. *This is consistent with the 2015 404(b)(1) evaluation.*

Nekton

Nekton are actively swimming aquatic organisms that range in size and complexity from plankton to marine mammals. Native fish present in the Project Area can be separated into anadromous species and resident species. Native anadromous species include Central Valley spring-run Chinook salmon, Sacramento River winter-run Chinook salmon, fall/late-fall run Chinook salmon, and California Central Valley steelhead trout.

Rock placement during construction would most likely disturb the native resident fish by increasing vibration, water turbulence, and turbidity, which could affect fish physiology, behavior, and habitat. The Proposed Action would temporarily eliminate the bankside vegetation that is an element of SRA habitat. The Proposed Action includes the installation of instream woody material and a planting bench that would have a beneficial effect on SRA habitat once the trees and shrubs mature. The natural bank element of SRA habitat would also be temporarily lost with the placement of rock along banks. Over time sediment would settle into the rock voids and provide similar substrate characteristics as a natural bank. The temporary reduction in SRA habitat resulting from the project would be mitigated by creation of riparian habitat along the Lower American River within the American River Parkway.

The direct and indirect effects resulting from the Proposed Action would not substantially worsen existing conditions, and would not result in a substantial reduction in population abundance, movement, and distribution. *This is consistent with the 2015 404(b)(1) evaluation.*

Aquatic Food Web

Effects on the plankton, benthic, and nekton communities can affect the broader the aquatic food web, which includes marine mammals that feed on Chinook salmon and steelhead that spawn and rear in the Lower American River before migrating to the Pacific Ocean. However, the Proposed Action's effects on the aquatic food web, or the plankton, benthic, and nekton communities, and thus the aquatic food web would be temporary, as described in the preceding sections. *This is consistent with the 2015 404(b)(1) evaluation.*

Special Aquatic Sites

Within the Project Area, there are no sanctuaries and refuges, mud flats, vegetated shallows, coral reefs, or riffle and pool complexes.

However, wetlands are present at the project site and would be affected by the Proposed Action. During development of the detailed design of the Proposed Action, reasonable efforts were taken to avoid disturbance of these existing wetlands and to implement environmentally sustainable designs. Nonetheless, 5.51 acres of forested wetland would be impacted, and would be replaced with 7.59 acre of riparian habitat on site, and 0.12 acre of emergent wetland. In addition, this impact would be mitigated by 8.10 acres of forested wetland at a mitigation site in the American River Parkway that will be selected and designed in coordination with NMFS and USFWS as part of the consultation under the Endangered Species Act. *This is consistent with the 2015 404(b)(1) evaluation.*

Threatened and Endangered Species

Two species federally listed as threatened are known to be present in the Project Area, and thus would be affected by the Proposed Action: Valley elderberry longhorn beetle (VELB) and California Central Valley steelhead. Three other federally listed species are likely to occur in the Project Area: western yellow-billed cuckoo (threatened), Sacramento River winter-run Chinook salmon (endangered), and Central Valley spring-run Chinook salmon (threatened). The Project Area is not within designated critical habitat for any listed terrestrial wildlife species, but is within designated critical habitat for Central Valley spring-run Chinook and California Central Valley steelhead.

One elderberry shrub without beetle exit holes would be directly affected by construction of Site 2-1, and 0.08 acres of riparian habitat within 25 meters (82 feet) of elderberry shrubs that is considered VELB habitat would be removed. Measures to minimize and mitigate these impacts would be implemented in accordance with the 2017 *Framework for Assessing Impacts to the Valley Elderberry Longhorn Beetle*[5].

The Project Area is unlikely to support nesting western yellow-billed cuckoos because nesting cuckoos have not been documented in along the Lower American River, and riparian vegetation in the Project Area is narrow with a high level of human disturbance. Nonetheless, pre-construction surveys would be conducted for the species. If nesting birds are detected, worker environmental awareness training would be conducted and avoidance buffers would be established. Riparian habitat within the Project Area also could support foraging cuckoos. Construction of Site 2-1 would remove of 10.43 acres of riparian habitat, and subsequently create 12.86 acres of replacement habitat on site. The project would also incorporate the creation of 8.10 acres of riparian habitat off site to mitigate the impact to yellow-billed cuckoo habitat.

The Proposed Action incorporates a riparian planting bench and instream woody material that in the long-term would improve habitat conditions for California Central Valley steelhead, Sacramento River winter-run Chinook salmon, and Central Valley spring-run Chinook salmon. However, in the short term, while trees and shrubs on the planting bench are maturing, there be an adverse impact on SRA habitat for these species. To

[5] U.S. Fish and Wildlife Service. 2017. *Framework for Assessing Impacts to the Valley Elderberry Longhorn Beetle* (Desmocerus californicus dimorphus). U.S. Fish and Wildlife Service; Sacramento, CA.

mitigate this short-term impact, the Proposed Action would create off-site SRA habitat in the American River Parkway.

The placement of fill materials by the Proposed Action would not jeopardize the continued existence of any species listed as threatened or endangered or result in the likelihood of destruction or adverse modification of any critical habitat as specified by the Endangered Species Act of 1973. *This is consistent with the 2015 404(b)(1) evaluation.*

Other Wildlife

The project site is used by a variety of species associated with annual grassland, mixed oak woodland, upland and riparian scrubs, riparian woodland, non-native woodland, and riverine habitats. Effects on fish species using riverine habitat at the project site are discussed in the preceding section regarding effects on the nekton. Grading and other ground-disturbing activities, noise from construction activities, and removal of vegetation could disrupt movement and foraging, or displace, injure, or kill wildlife. However, these effects would be temporary and many affected species would be expected to return to areas affected by construction once such work is completed. Additionally, there would be extensive similar, unaffected, areas of riparian, oak woodland, and grassland habitat in the vicinity of the project site and along the Lower American River that could be used by these species. Therefore, for most species of terrestrial wildlife, the Proposed Action would not result in a substantial reduction in population abundance, movement, and distribution; and thus, the effects on these species would be less than significant. However, in addition to the federally listed as threatened or endangered that were discussed previously, a number of special-status species likely use the project site. These species are less abundant, have more limited distributions, and are more vulnerable to population-level effects than common wildlife species. These special-status species include western pond turtle, American badger, pallid bat and western red bat, and several raptors and other birds that may nest at or in the vicinity of the project site (Swainson's hawk, Cooper's hawk, white-tailed kite, burrowing owl, great egret, great blue heron, and purple martin).

To minimize potential effects on these special-status species, the applicable avoidance and minimization measures from the GRR EIS/EIR have been incorporated into the Proposed Action, with revisions to reflect the revised Project Area and current mitigation requirements. These measures include worker environmental awareness training; pre-construction surveys for western pond turtles, bat maternity roosts, American badger dens, and nesting birds (note: removal of trees in the project footprint would occur before the nesting season); and establishment of avoidance buffers as necessary. Implementing these measures would protect maternity roosts of special-status bats, and avoid or minimize effects on western pond turtle, American badger, and nesting birds. In addition to GRR EIS/EIR measures incorporated into the project, a measure has been incorporated to avoid or minimize impacts to nests of Crotch's bumblebee, a candidate for State listing as threatened or endangered.

Furthermore, on-site replacement of riparian habitat and restoration of riparian habitat off-site as compensatory mitigation would provide replacement habitat at a 2:1 ratio, which in the long-term would improve habitat conditions for riparian-associated species. *This is consistent with the 2015 404(b)(1) evaluation.*

Cumulative Effects on the Aquatic Ecosystem

Effects of the proposed action include temporary reductions in nearshore aquatic and riparian habitats that are used by aquatic and terrestrial species, and permanent placement of riprap on earthen banks alters natural fluvial processes that sustain high-value nearshore and floodplain habitats in alluvial river systems.

Ongoing non-federal activities that effect listed salmonids and valley elderberry longhorn beetle, and their habitat, will likely continue in the short- term, at intensities similar to those of recent years. However, some activities associated with the State's proposed Central Valley Flood Protection Plan or state or local efforts to implement the Engineering Pamphlet (EP) 1110-2-18 could result in increased effects on listed species. Potential cumulative effects on fish also may include any continuing or future non-federal diversions of water that may entrain adult or larval fish or that may incrementally decrease outflows or water quality, thus changing habitat for these species.

Potential cumulative effects on all species discussed above could include: wave action in the water channel caused by boats that may degrade riparian and wetland habitat and erode banks; dumping of domestic and industrial garbage; land uses that result in increased discharges of pesticides, herbicides, oil, and other contaminants; and conversion of riparian areas for urban development. In addition, routine vegetation clearing and mowing associated with agricultural practices may affect or remove habitat for the valley elderberry longhorn beetle.

Human Use Characteristics

Municipal and Private Water Supplies

Proposed Action's fill material would not violate Environmental Protection Agency or State water quality standards or violate the primary drinking water standards of the Safe Drinking Water Act (42 USC 300f-300j). Also, the Proposed Action's design, compliance with State water quality thresholds and standard construction and erosion practices would preclude the introduction of substances into surrounding waters, and materials removed for disposal off-site would be disposed of in an appropriate landfill or other upland area. *This is consistent with the 2015 404(b)(1) evaluation.*

Recreation and Commercial Fisheries

The Proposed Action would cause temporary closure of recreation facilities in the American River Parkway during construction. At Site 2-1, the entire length of the upper levee crown trail and lower landside and waterside trails would be closed entirely during

the construction period, while the lower landside bicycle recreational trail from the H Street Bridge south to the exit onto State University Drive at the Hornet Bookstore could be closed during most of the active construction season. Haul trucks and other construction equipment would use portions of the recreational trails to move materials along the banks of the river, reducing accessibility to recreationists. Access along all the open available recreational trails would be impaired at locations where construction equipment would cross from landside staging areas or hauling in materials from off site to the staging areas. Construction staging areas would also restrict the use of and access to recreational areas, such as the staging areas at Paradise Beach and Glenn Hall Park reducing the quality of recreational experiences in those areas. Access to the staging area for Site 2-1 would also impact access to residents using the parking lot entrance to the Glenn Hall Pool and Glenn Hall Park. Also, recreational access to the banks at Site 2-1 would be completely restricted during the construction period due to construction activities and potential hazards to recreationists, including fishing, swimming, and boating. To minimize these effects on recreation, the Proposed Action incorporates, with clarifying modifications, the related mitigation measure in the GRR EIS/EIR This measure includes notification and coordination with user groups, posting signage, use of flaggers and traffic control, provision of marked detours, posting alternative access points if any access points are closed, and restoring access and repairing any damage to recreational facilities to pre-project conditions. *This is consistent with the 2015 404(b)(1) evaluation.*

The Proposed Action would impact habitat for commercial fish species by causing temporary increases in turbidity and short-term loss of the elements of SRA habitat. (The Proposed Action incorporates a riparian planting bench and instream woody debris that in the long-term would improve SRA habitat conditions.) As described previously under "Suspended Particulates/Turbidity," increases in turbidity would be minimized to a less-than-significant level through implementation of a SWPPP and associated BMPs, and installation, prior to in-water work, of a turbidity curtain or other comparable minimization measure. The short-term adverse impact on SRA habitat would be mitigated by the creation of off-site SRA habitat in the American River Parkway. *This is consistent with the 2015 404(b)(1) evaluation.*

Aesthetics

The Proposed Action would result in vegetation loss and construction activities that would disrupt the existing visual conditions in the Parkway. Trees would be planted after construction is completed on planting berms and on top of launchable rock trenches and disturbed areas would be reseeded with native grasses. However, there would still be a temporal loss of vegetation. In addition, the Proposed Action incorporates an GRR EIS/EIR mitigation measure that would also plant additional trees at other areas in the Parkway according to the Parkway Plan to mitigate for the removal of the trees. *This is consistent with the 2015 404(b)(1) evaluation.*

Parks, National and Historic Monuments, National Seashores, Wilderness Areas, Research Sites, and Similar Preserves

The Proposed Action would affect the American River Parkway. Construction of the Proposed Action would last for one year. During that time, it would affect Paradise Beach, Glenn Hall Park, and the upper levee crown trail and lower landside and waterside trails at Site 2-1. The Proposed Action incorporates, with clarifying modifications, the mitigation measure in the GRR EIS/EIR that would minimize potential effects to recreational users. This measure includes notification and coordination with user groups, posting signage, use of flaggers and traffic control, provision of marked detours, posting alternative access points if any access points are closed, and restoring access and repairing any damage to recreational facilities to pre-project conditions. *This is consistent with the 2015 404(b)(1) evaluation.*

The Proposed Action would result in only localized and temporary closures, and the proposed improvements at Site 2-1 would reduce the potential for future closures of recreational facilities. The Proposed Action would also not preclude future access to recreational areas. Therefore, it would not conflict with the purposes and intents of the American River Parkway Plan and the Wild and Scenic Rivers Act. *This is substantially consistent with the 2015 404(b)(1) evaluation.*

Other Considerations

The revegetation within the planting bench is in accordance of EP 1110-2-18, which provides guidelines to assure that landscape planting and vegetation management provide aesthetic and environmental benefits without compromising the reliability of levees, floodwalls, embankment dams, and appurtenant structures.

Logistically, there are no major encumbrances to completing the work. Local ordinances and real estate are not an issue for this site.

The proposed action is fully funded. This action is part of the American River Common Features Project which was included in the FY18 Bipartisan Budget Act (Public Law [P.L.]115-123) which funded $1.56B of the remaining design and construction efforts (full first cost). Receipt of full-funding changed the approach of the project execution substantially and reduced the overall timeline to five years, with a targeted completion of all flood risk reduction features by January 2023. The construction schedule has the construction to be completed in 2022.

VIA ELECTRONIC MAIL: (PublicComment@cvflood.ca.gov)

Subject: Draft Supplemental Environmental Assessment/Environmental Impact Report (SEA/EIR) for the American River Common Features, Water Resources Development Act of 2016, American River Contract 1, Sacramento County

Dear Mr. Claret:

The California State Lands Commission (Commission) staff has reviewed the subject Draft SEA/EIR for the American River Common Features Development Act of 2016, American River Contract 1 (Project), which is being prepared by the Central Valley Flood Protection Board (CVFPB), as the lead agency under the California Environmental Quality Act (CEQA) (Pub. Resources Code, § 21000 et seq.), and the U.S. Army Corps of Engineers (Corps) as the lead agency under the National Environmental Policy Act (NEPA) (42 U.S.C. § 4321 et seq.). The Commission is a trustee agency for projects that could directly or indirectly affect sovereign lands and their accompanying Public Trust resources or uses. Additionally, because the Project involves work on sovereign lands, the Commission will act as a responsible agency.

Commission Jurisdiction and Public Trust Lands

The Commission has jurisdiction and management authority over all ungranted tidelands, submerged lands, and the beds of navigable lakes and waterways. The Commission also has certain residual and review authority for tidelands and submerged lands legislatively granted in trust to local jurisdictions (Pub. Resources Code, §§ 6009, subd. (c); 6009.1; 6301; 6306). All tidelands and submerged lands granted or ungranted, as well as navigable lakes and waterways, are subject to the protections of the common law Public Trust Doctrine.

As general background, the State of California acquired sovereign ownership of all tidelands and submerged lands and beds of navigable lakes and waterways upon its

admission to the United States in 1850. The State holds these lands for the benefit of all people of the State for statewide Public Trust purposes, which include but are not limited to waterborne commerce, navigation, fisheries, water-related recreation, habitat preservation, and open space.

Based on the information submitted in the SEA/EIR, a portion of Site 2-1 is located on State-owned sovereign land in the lower American River below the ordinary low water mark. To the extent that any portion of the proposed levee improvement project involves State-owned sovereign lands in the American River, a lease will be required. The Department of Water Resources submitted an application to the Commission on January 6, 2020. Access from the American River to the three mitigation sites addressed in the SEA/EIR may also require approval from the Commission. If you have any questions, please contact Joanne Holt, Public Land Management Specialist (see contact information below) to discuss the Commission's leasing requirements. 1-1

Please also be advised that the waterways involved in the Project are subject to a public navigational easement. This easement provides that the public has the right to navigate and exercise the incidences of navigation in a lawful manner on State waters that are capable of being physically navigated by oar or motor-propelled small craft. Such uses may include, but are not limited to, boating, rafting, sailing, rowing, fishing, fowling, bathing, skiing, and other water-related public uses. The activities completed under the Project must not restrict or impede the easement right of the public. 1-2

Project Description

CVFPB proposes to install erosion protection features along the Lower American River at levee site 2-1. The purpose of the Project is to reduce the overall flood risk within the study area. The design of Site 2-1 was prepared to:

- Minimize impacts on hydraulic capacity
- Maximize the width of the planting benches without impacting hydraulic capacity
- Minimize excavation into the existing berm and preserving existing resources where possible
- Minimize the footprint into the existing channel.

From the Project Description, Commission staff understands that the Project would include the following components that have potential to affect State sovereign land:

- Bank protection (rock revetment) would be placed on the existing bank at a slope varying from a 2:1 slope to a 3:1 slope, extending below the ordinary low-water mark (OLWM).

- A planting bench (trench) would be constructed in the rock, filled with soil, and planted with native grasses, shrubs, and trees with shallow root systems to ensure that they do not limit the functionality of the trench during a flood event.

- Small dead trees with intact root wads, also referred to as in-stream woody material (IWM), would be anchored in lower elevation bench areas, and a mix of water dependent herbaceous plants would be planted.

Environmental Review

Commission staff requests that the lead agencies consider the following comments on the Project's Draft SEA/EIR.

General Comments

1. In Section 2.3.1.2, the SEA/EIR states that "All launchable-rock trenches would be constructed outside of the natural river channel;" however on Figure 2-5, the trench is shown to be below the ordinary high-water mark (OHWM); therefore, staff suggests that "natural river channel" be replaced with the phrase "main channel." In addition, the section states that "[t]he bottom of the trench would be constructed close to the summer mean water surface elevation…". Please clarify whether the "summer mean water surface elevation" is comparable to the ordinary low water mark (OLWM), to help establish what activities would be performed on lands under the jurisdiction of the Commission. 1-3

Cultural Resources

2. Tribal Consultation: Page 3-91 states that the Shingle Springs Band of Miwok Indians, Wilton Rancheria, and the United Auburn Indian Community (UAIC) requested consultation in February of 2020 and that the consultation is ongoing at this time. Commission staff requests that the results of consultation be provided when complete. 1-4

3. Title to Resources: Commission staff requests the Archaeological Discovery Plan (Mitigation Measure [MM] CR-2, found on page 3-96) include a statement that the title to all archaeological sites, and historic or cultural resources on or in the tide and submerged lands of California is vested in the State and under the jurisdiction of the Commission (Pub. Resources Code, § 6313). Commission staff also requests that MM CR-4 include the following statement: "The final disposition of archaeological, historical, and paleontological resources recovered on State lands under the jurisdiction of the California State Lands Commission must be approved by the Commission." Finally, Commission staff requests that the lead agencies consult with staff attorney Jamie Garrett (see contact information below) should any cultural resources on State lands be discovered during construction of the proposed Project. 1-5

Climate Change

4. Climate change is mentioned in Section 3.10, *Greenhouse Gas Emissions and Energy Consumption* of the Draft SEA/EIR; however, there is no distinct discussion of how the Project would address aspects of climate change other than greenhouse gases that are relevant to the Project. The Project area is located in a portion of the 1-6

American River that is not tidally influenced and therefore, would not be subject to sea-level rise. However, as stated in *Safeguarding California Plan: 2018 Update* (California Natural Resources Agency 2018), climate change is projected to increase the frequency and severity of natural disasters related to flooding, drought, and storms. In rivers, more frequent and powerful storms can result in increased flooding conditions and damage from storm-created debris as well as decreased bank stability and structure. Conversely, climate-change induced droughts could decrease river levels and flow for extended periods of time. Although relevant information is provided throughout the document, Staff suggests that CVFPB consider adding a separate discussion of how the work purposed at Site 2-1 addresses the potential effects of climate change noted above.

1-6 (cont.)

Recreation

5. The SEA/EIR (page 3-144) states that no fishing, swimming, or boating would be possible at the site during construction; however, it is unclear if boaters would have access past the site and if so, what offshore safety measures would be implemented?

1-7

Thank you for the opportunity to comment on the Draft SEA/EIR for the Project. As a responsible and trustee agency, the Commission will need to rely on the Final SEIR for the issuance of any lease as specified above and, therefore, we request that you consider our comments prior to certification of the SEIR. Please send copies of future Project-related documents, including electronic copies of the certified SEIR, Mitigation Monitoring and Reporting Program, Notice of Determination, Findings, Statement of Overriding Considerations, and approving resolution when they become available. Please refer questions concerning environmental review to Cynthia Herzog, Senior Environmental Scientist, at (916) 574-1310 or cynthia.herzog@slc.ca.gov. For questions concerning archaeological or historic resources under Commission jurisdiction, please contact Staff Attorney Jamie Garrett, at (916) 574-0398 or jamie.garrett@slc.ca.gov. For questions concerning Commission leasing jurisdiction, please contact Joanne Holt Public Land Management Specialist, at (916) 574-1832 or Joanne.Holt@slc.ca.gov.

1-8

Sincerely,

Eric Gillies, Acting Chief
Division of Environmental Planning
and Management

RE: Draft Supplemental EA/EIR for American River Watershed Common Features, Water Resources Development Act of 2016, American River Contract 1 Project (SAC201301442)

Dear Mr. Claret and USACE Public Affairs Office:

Thank you for providing the Draft Supplemental Environmental Assessment/Environmental Impact Report (DSEA/EIR) for the American River Contract 1 Project to the Sacramento Metropolitan Air Quality Management District (Sac Metro Air District) for review. The project includes approximately 5,500 linear feet of bank stabilization work along the American River between Paradise Beach and the Guy West Bridge. The purpose of the DSEA/EIR is to analyze modifications and refinements made to the project since the publication of the American River Watershed Common Features General Reevaluation Report (GRR) Final Environmental Impact Statement/Environmental Impact Report, December 2015 (revised May 2016). Sac Metro Air District staff comments on the American River Contract 1 Project DSEA/EIR follow.

Because the American River Contract 1 Project is part of the GRR, all mitigation measures and project environmental commitments from the GRR and its General Conformity Determination (copy in Appendix F) must be included. 2-1

- Specifically, mitigation measure AQ-3: Develop and Implement a Plan for Enhanced On-Site Exhaust Controls, should clearly include the commitments from the GRR General Conformity Determination to use 90% Tier 4 off-road construction equipment (Measure 4), prohibit the use of Tier 0 off-road construction equipment (Measure 4), and to use on-road haul trucks with 2010 or newer engines (Measure 3). These GRR measures were designed to reduce construction emissions to below General Conformity levels in the years the American River Contract 1 work will be conducted. 2-2
- It is not necessary to use the Sac Metro Air District's current mitigation measure language requiring a 10% NOX reduction (noted on pages 3-117 and 3-120) since the project must apply the more stringent measures noted in the above bullet. 2-3
- Measure 1 of the GRR General Conformity Determination requires monthly equipment submittals and emissions tracking. The Sac Metro Air District's construction mitigation language currently included in AQ-3 specifies only 2 reports, an initial and final. This language should be replaced with the monthly reporting language from Measure 1. 2-4

Sac Metro Air District recommends minor modifications to the DSEA/EIR to provide accuracy and clarity. 2-5

- Off-site emissions reductions fees collected by the Sac Metro Air District are used to fund emission reduction programs. The Heavy-Duty Vehicle Incentive Program is only one program that may be funded (page 3-111).

- Correct the emission modeling and assumptions reference from Appendix D to Appendix E (pages 3-113 and 3-127).
- Table 3.9-1 on page 3-116 can be misleading by showing zero thresholds for PM10 and PM2.5 and then stating the project does not exceed those. Suggest putting the non-zero thresholds in the table and modifying Footnote 2 to state that although the thresholds are zero, since the project includes best management practices, the non-zero thresholds can be used to determine project significance.
- Correct the reference to the Sac Metro Air District's greenhouse gas thresholds adoption and the CAPCOA document on pages 3-127 and 3-128. The Sac Metro Air District's Board of Directors adopted greenhouse gas thresholds of significance on October 23, 2014. The 2008 CAPCOA document referenced was used to inform the thresholds development.

2-5 (cont.)

All projects are subject to Sac Metro Air District rules in effect at the time of construction. A list of common construction related rules[i] and the complete listing of rules[ii] are available on the Sac Metro Air District's website. Links are provided in the endnotes.

2-6

You may contact me at 916-874-4881 or khuss@airquality.org if you have questions regarding these comments.

Sincerely,

Karen Huss

CALIFORNIA Water Boards

GAVIN NEWSOM GOVERNOR

JARED BLUMENFELD SECRETARY FOR ENVIRONMENTAL PROTECTION

Central Valley Regional Water Quality Control Board

20 July 2020

Miles Claret
Department of Water Resources
3464 El Camino Avenue, Suite 150
Sacramento, CA 95821

COMMENTS TO REQUEST FOR REVIEW FOR THE DRAFT SUPPLEMENTAL ENVIRONMENTAL IMPACT REPORT, AMERICAN RIVER WATERSHED COMMON FEATURES, WATER RESOURCES DEVELOPMENT ACT OF 2016, AMERICAN RIVER CONTRACT 1 PROJECT, SCH#2005072046, SACRAMENTO COUNTY

Pursuant to the State Clearinghouse's 5 June 2020 request, the Central Valley Regional Water Quality Control Board (Central Valley Water Board) has reviewed the *Request for Review for the Draft Supplemental Environmental Impact Report* for the American River Watershed Common Features, Water Resources Development Act of 2016, American River Contract 1 Project, located in Sacramento County.

Our agency is delegated with the responsibility of protecting the quality of surface and groundwaters of the state; therefore our comments will address concerns surrounding those issues.

Central Valley Water Board staff recommends including turbidity language from section 3.1.21 of the Basin Plan specific to Folsom Lake and the Lower American River to turbidity language included in Mitigation Measure WQ-1. The recommended additional language is underlined below:

- During working hours, the construction activity would not cause the turbidity in the adjacent water body down current from the construction sites to exceed the Basin Plan turbidity objectives. Specifically, where natural turbidity is between 0 and 5 nephelometric turbidity units (NTUs), increases would not exceed 1 NTU; where natural turbidity is between 5 and 50 NTUs, increases would not exceed 20 percent; where natural turbidity is between 50 and 100 NTUs, increases would not exceed 10 NTUs; and where natural turbidity is greater than 100 NTUs, increases would not exceed 10 percent. 19 In determining compliance with these limits, appropriate averaging periods could be applied, provided that beneficial uses would be fully protected. <u>Exceptions to the above limits will be considered when a dredging operation can cause</u>

3-1

an increase in turbidity. In those cases, an allowable zone of dilution within which turbidity in excess of the limits may be tolerated will be defined for the operation and prescribed in a discharge permit. For Folsom Lake and American River (Folsom Dam to Sacramento River), except for periods of storm runoff, the turbidity shall be less than or equal 10 NTUs. To the extent of any conflict with the general turbidity objective, the more stringent applies.

3-1 (cont.)

I. Regulatory Setting

Basin Plan

The Central Valley Water Board is required to formulate and adopt Basin Plans for all areas within the Central Valley region under Section 13240 of the Porter-Cologne Water Quality Control Act. Each Basin Plan must contain water quality objectives to ensure the reasonable protection of beneficial uses, as well as a program of implementation for achieving water quality objectives with the Basin Plans. Federal regulations require each state to adopt water quality standards to protect the public health or welfare, enhance the quality of water and serve the purposes of the Clean Water Act. In California, the beneficial uses, water quality objectives, and the Antidegradation Policy are the State's water quality standards. Water quality standards are also contained in the National Toxics Rule, 40 CFR Section 131.36, and the California Toxics Rule, 40 CFR Section 131.38.

The Basin Plan is subject to modification as necessary, considering applicable laws, policies, technologies, water quality conditions and priorities. The original Basin Plans were adopted in 1975, and have been updated and revised periodically as required, using Basin Plan amendments. Once the Central Valley Water Board has adopted a Basin Plan amendment in noticed public hearings, it must be approved by the State Water Resources Control Board (State Water Board), Office of Administrative Law (OAL) and in some cases, the United States Environmental Protection Agency (USEPA). Basin Plan amendments only become effective after they have been approved by the OAL and in some cases, the USEPA. Every three (3) years, a review of the Basin Plan is completed that assesses the appropriateness of existing standards and evaluates and prioritizes Basin Planning issues. For more information on the *Water Quality Control Plan for the Sacramento and San Joaquin River Basins*, please visit our website:
http://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/

3-2

Antidegradation Considerations

All wastewater discharges must comply with the Antidegradation Policy (State Water Board Resolution 68-16) and the Antidegradation Implementation Policy contained in the Basin Plan. The Antidegradation Implementation Policy is available on page 74 at:
https://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/sacsjr_201805.pdf

In part it states:

Any discharge of waste to high quality waters must apply best practicable treatment or control not only to prevent a condition of pollution or nuisance from occurring, but

also to maintain the highest water quality possible consistent with the maximum benefit to the people of the State.

This information must be presented as an analysis of the impacts and potential impacts of the discharge on water quality, as measured by background concentrations and applicable water quality objectives.

The antidegradation analysis is a mandatory element in the National Pollutant Discharge Elimination System and land discharge Waste Discharge Requirements (WDRs) permitting processes. The environmental review document should evaluate potential impacts to both surface and groundwater quality.

II. Permitting Requirements

Construction Storm Water General Permit

Dischargers whose project disturb one or more acres of soil or where projects disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres, are required to obtain coverage under the General Permit for Storm Water Discharges Associated with Construction Activities (Construction General Permit), Construction General Permit Order No. 2009-009-DWQ. Construction activity subject to this permit includes clearing, grading, grubbing, disturbances to the ground, such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility. The Construction General Permit requires the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP). For more information on the Construction General Permit, visit the State Water Resources Control Board website at: http://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml

3-2 (cont.)

Clean Water Act Section 404 Permit

If the project will involve the discharge of dredged or fill material in navigable waters or wetlands, a permit pursuant to Section 404 of the Clean Water Act may be needed from the United States Army Corps of Engineers (USACE). If a Section 404 permit is required by the USACE, the Central Valley Water Board will review the permit application to ensure that discharge will not violate water quality standards. If the project requires surface water drainage realignment, the applicant is advised to contact the Department of Fish and Game for information on Streambed Alteration Permit requirements. If you have any questions regarding the Clean Water Act Section 404 permits, please contact the Regulatory Division of the Sacramento District of USACE at (916) 557-5250.

Clean Water Act Section 401 Permit – Water Quality Certification

If an USACE permit (e.g., Non-Reporting Nationwide Permit, Nationwide Permit, Letter of Permission, Individual Permit, Regional General Permit, Programmatic General Permit), or any other federal permit (e.g., Section 10 of the Rivers and Harbors Act or Section 9 from the United States Coast Guard), is required for this project due to the disturbance of waters of the United States (such as streams and wetlands), then a Water Quality Certification must be obtained from the Central

Valley Water Board prior to initiation of project activities. There are no waivers for 401 Water Quality Certifications. For more information on the Water Quality Certification, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/water_issues/water_quality_certification/

Waste Discharge Requirements – Discharges to Waters of the State

If USACE determines that only non-jurisdictional waters of the State (i.e., "non-federal" waters of the State) are present in the proposed project area, the proposed project may require a Waste Discharge Requirement (WDR) permit to be issued by Central Valley Water Board. Under the California Porter-Cologne Water Quality Control Act, discharges to all waters of the State, including all wetlands and other waters of the State including, but not limited to, isolated wetlands, are subject to State regulation. For more information on the Waste Discharges to Surface Water NPDES Program and WDR processes, visit the Central Valley Water Board website at:https://www.waterboards.ca.gov/centralvalley/water_issues/waste_to_surface_water/

Projects involving excavation or fill activities impacting less than 0.2 acre or 400 linear feet of non-jurisdictional waters of the state and projects involving dredging activities impacting less than 50 cubic yards of non-jurisdictional waters of the state may be eligible for coverage under the State Water Resources Control Board Water Quality Order No. 2004-0004-DWQ (General Order 2004-0004). For more information on the General Order 2004-0004, visit the State Water Resources Control Board website at: https://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2004/wqo/wqo2004-0004.pdf

3-2 (cont.)

Dewatering Permit

If the proposed project includes construction or groundwater dewatering to be discharged to land, the proponent may apply for coverage under State Water Board General Water Quality Order (Low Threat General Order) 2003-0003 or the Central Valley Water Board's Waiver of Report of Waste Discharge and Waste Discharge Requirements (Low Threat Waiver) R5-2018-0085. Small temporary construction dewatering projects are projects that discharge groundwater to land from excavation activities or dewatering of underground utility vaults. Dischargers seeking coverage under the General Order or Waiver must file a Notice of Intent with the Central Valley Water Board prior to beginning discharge.

For more information regarding the Low Threat General Order and the application process, visit the Central Valley Water Board website at: http://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2003/wqo/wqo2003-0003.pdf

For more information regarding the Low Threat Waiver and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/waivers/r5-2018-0085.pdf

Limited Threat General NPDES Permit

If the proposed project includes construction dewatering and it is necessary to discharge the groundwater to waters of the United States, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. Dewatering discharges are typically considered a low or limited threat to water quality and may be covered under the General Order for *Limited Threat Discharges to Surface Water* (Limited Threat General Order). A complete Notice of Intent must be submitted to the Central Valley Water Board to obtain coverage under the Limited Threat General Order. For more information regarding the Limited Threat General Order and the application process, visit the Central Valley Water Board website at:
https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/general_orders/r5-2016-0076-01.pdf

3-2 (cont.)

NPDES Permit

If the proposed project discharges waste that could affect the quality of surface waters of the State, other than into a community sewer system, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. A complete Report of Waste Discharge must be submitted with the Central Valley Water Board to obtain a NPDES Permit. For more information regarding the NPDES Permit and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/help/permit/

If you have questions regarding these comments, please contact me at (916) 464-4812 or Jordan.Hensley@waterboards.ca.gov.

RE: County of Sacramento Department of Regional Parks Comments on the Draft Supplemental EA/EIR for American River Watershed Common Features, Water Development Act of 2016, American River Contract 1

Dear Mr. Claret:

Thank you for providing Sacramento County Department of Regional Parks the opportunity to provide comments on the proposed project's Draft Supplemental EA/EIR (Document). The project entails building bank protection with a planting bench and launchable rock toe, anchored trees and tie backs. Proposed off-site mitigation areas are located at Paradise Beach/Glenn Hall Park and the Rio Americano East and West Sites. We understand that the project partners will continue to coordinate with Sacramento County Department of Regional Parks, through the Bank Protection Working Group, as well as with our planning efforts to align on the most reasonable long-term approach to mitigation in the American River Parkway (Parkway). Our comments pertain to public outreach, trail closures, and long-term maintenance of the bank protection site.

Public Outreach:

- The project should provide a project description, alongside the signage for closure and detours, to communicate to Parkway users, that are passing through the area, what is happening in the area. 4-1

10361 Rockingham Drive, Suite 100 Sacramento, CA 95827 • phone (916) 875-6961 • fax (916) 875-6632 • www.saccounty.net

- We appreciate the public outreach that the USACE continues to provide to the Parkway users, stakeholders, and to the surrounding community through press releases, public meetings, social media, and other public outreach.
- We appreciate that the project team is coordinating with other projects, (such as CalTrans and City of Sacramento) occurring in the area to mitigate cumulative project impacts to the community and to community services.
- We request that the rebuilding of the maintenance road at Site 2-1 be coordinated to support the construction of the City of Sacramento's Two Rivers Trail, as Project Mitigation for significant recreational impacts.

4-1 (cont.)

Trail Closures:

The Document states that the Proposed Action at the off-site Rio Americano mitigation areas would result in temporary closures of parts of the Jedediah Smith Recreation Trail during construction activities.

- We request that paved trail closures be minimized through the use of flagpersons, and that
- off-site mitigation construction traffic use maintenance roads as feasible.

The Document also states that on Site 2-1, the entire length of the upper levee crown trail and maintenance road, and informal waterside paths would be closed entirely during the construction period, while the lower landside bicycle recreational trail from the H Street Bridge south to the exit onto State University Drive at the Hornet Bookstore could be closed during most of the active construction season.

- Our trail closure policy requires a 14 day notice for paved trail closures: We request that Mitigation Measure REC-1 be changed to say "Closures of the paved trails require a *14 day* advance notice to trail users, via signage at the detour locations."
- We also request that the paved trails, trail levee crown, and/or maintenance roads at Site 2-1 be made available to the public during times when it is safe and feasible to do so. The Document states that the closure may be as long as 1 ½ years, which we request be shortened, or broken into shorter closure times as feasible. For example, it may be possible to open the levee top to recreational use after major construction has been completed, and the site is being planted.

4-2

Long-Term Maintenance of Bank Protection Site:

- The Operations and Maintenance Manual (O&M Manual) for this project should require that the Site 2-1 planting bench be repaired and/or rebuilt, as needed to benefit fish and wildlife habitat, especially if the rock trench launches during a flood event.

4-3

Finally, our Department's name has changed over the years and needs to be consistent in the Document to read "Sacramento County Department of Regional Parks".

4-4

We appreciate the opportunity to comment. If you have any questions please contact Mary Maret at (916) 875-4918 or maretm@saccounty.net.

Sincerely,

Liz Bellas

RE: County of Sacramento Department of Regional Parks Comments on the Draft Supplemental EA/EIR for American River Watershed Common Features, Water Development Act of 2016, American River Contract 1

Dear Mr. Claret:

Thank you for providing Sacramento County Department of Regional Parks the opportunity to provide comments on the proposed project's Draft Supplemental EA/EIR (Document). The project entails building bank protection with a planting bench and launchable rock toe, anchored trees and tie backs. Proposed off-site mitigation areas are located at Paradise Beach/Glenn Hall Park and the Rio Americano East and West Sites. We understand that the project partners will continue to coordinate with Sacramento County Department of Regional Parks, through the Bank Protection Working Group, as well as with our planning efforts to align on the most reasonable long-term approach to mitigation in the American River Parkway (Parkway). Our comments pertain to public outreach, trail closures, and long-term maintenance of the bank protection site.

Public Outreach:

- The project should provide a project description, alongside the signage for closure and detours, to communicate to Parkway users that are passing through the area, what is happening in the area.

5-1

- We appreciate the public outreach that the USACE continues to provide to the Parkway users, stakeholders, and to the surrounding community through press releases, public meetings, social media, and other public outreach.
- We appreciate that the project team is coordinating with other projects, (such as CalTrans and City of Sacramento) occurring in the area to mitigate cumulative project impacts to the community and to community services.
- We request that the rebuilding of the maintenance road at Site 2-1 be coordinated to support the construction of the City of Sacramento's Two Rivers Trail, as Project Mitigation for significant recreational impacts.

5-1 (cont.)

Trail Closures:

The Document states that the Proposed Action at the off-site Rio Americano mitigation areas would result in temporary closures of parts of the Jedediah Smith Recreation Trail during construction activities.

- We request that paved trail closures be minimized through the use of flagpersons, and that
- off-site mitigation construction traffic use maintenance roads as feasible.

The Document also states that on Site 2-1, the entire length of the upper levee crown trail and maintenance road, and informal waterside paths would be closed entirely during the construction period, while the lower landside bicycle recreational trail from the H Street Bridge south to the exit onto State University Drive at the Hornet Bookstore could be closed during most of the active construction season.

- Our trail closure policy requires a 14 day notice for paved trail closures: We request that Mitigation Measure REC-1 be changed to say "Closures of the paved trails require a *14 day* advance notice to trail users, via signage at the detour locations."
- We also request that the paved trails, trail levee crown, and/or maintenance roads at Site 2-1 be made available to the public during times when it is safe and feasible to do so. The Document states that the closure may be as long as 1 ½ years, which we request be shortened, or broken into shorter closure times as feasible. For example, it may be possible to open the levee top to recreational use after major construction has been completed, and the site is being planted.

5-2

Long-Term Maintenance of Bank Protection Site:

- The Operations and Maintenance Manual (O&M Manual) for this project should require that the Site 2-1 planting bench be repaired and/or rebuilt, as needed to benefit fish and wildlife habitat, especially if the rock trench launches during a flood event.

5-3

Finally, our Department's name has changed over the years and needs to be consistent in the Document to read "Sacramento County Department of Regional Parks".

5-4

We appreciate the opportunity to comment. If you have any questions please contact Mary Maret at (916) 875-4918 or maretm@saccounty.net.

Sincerely,

Liz Bellas

Subject: **American River Watershed Common Features, Water Resources Development Act of 2016, American River Contract 1 | EIR | 2005072046**

Dear Mr. Claret:

The Sacramento Municipal Utility District (SMUD) appreciates the opportunity to provide comments on the Draft Environmental Impact Report (EIR) for the American River Watershed Common Features, Water Resources Development Act of 2016, American River Contract 1 (Project, SCH 2005072046). SMUD is the primary energy provider for Sacramento County and the proposed Project area. SMUD's vision is to empower our customers with solutions and options that increase energy efficiency, protect the environment, reduce global warming, and lower the cost to serve our region. As a Responsible Agency, SMUD aims to ensure that the proposed Project limits the potential for significant environmental effects on SMUD facilities, employees, and customers.

It is our desire that the Project EIR will acknowledge any Project impacts related to the following:

- Overhead and or underground transmission and distribution line easements. Please view the following links on smud.org for more information regarding transmission encroachment: 6-1
  - https://www.smud.org/en/Business-Solutions-and-Rebates/Design-and-Construction-Services
  - https://www.smud.org/en/Corporate/Do-Business-with-SMUD/Land-Use/Transmission-Right-of-Way
- Utility line routing
- Electrical load needs/requirements
- Energy Efficiency 6-2
- Climate Change 6-3
- Cumulative impacts related to the need for increased electrical delivery 6-4
- The potential need to relocate and or remove any SMUD infrastructure that may be affected in or around the project area 6-5

More specifically, SMUD would like to have the following details related to the electrical infrastructure incorporated into the project description:

SMUD has existing electrical facilities located throughout the project area footprint. All CalOSHA and State of California Public Utilities Commission safety clearances must be maintained during construction and upon completion. If any clearances cannot be maintained the project proponent shall be responsible for the cost of utility relocation. Upon project completion, all access and clearances must be maintained around all SMUD facilities. Public utility easements may be required for any new construction. 6-6

Both overhead 21kV lines and underground 12kV lines run adjacent to or within the project area and must remain. 6-7

SMUD would like to be involved with discussing the above areas of interest as well as discussing any other potential issues. We aim to be partners in the efficient and sustainable delivery of the proposed Project. Please ensure that the information included in this response is conveyed to the Project planners and the appropriate Project proponents. 6-8

Environmental leadership is a core value of SMUD and we look forward to collaborating with you on this Project. Again, we appreciate the opportunity to provide input on this EIR. If you have any questions regarding this letter, please do not hesitate to contact me at 916.732.6676, or by email at rob.ferrera@smud.org.

Sincerely,

Rob Ferrera

CALIFORNIA NATIVE PLANT SOCIETY
SACRAMENTO VALLEY CHAPTER

July 20, 2020

Public Affairs Office
U.S. Army Corps of Engineers
1325 J Street Room 1513
Sacramento, CA 95814
spk-pao@usace.army.mil

Public Affairs Office of the U.S. Army Corps of Engineers:

I am writing on behalf of the Sacramento Valley Chapter of the California Native Plant Society regarding the Draft Supplemental EA/EIR for the American River Contract 1 - American River Watershed Common Features GRR.

Our comments are as follows:

1. Provide clarification on proposed habitat restoration for Site 2-1 impacts as showna on Table 3.4-2, and proposed to occur at Site 2-1 and on "off-site" mitigationa areas as shown on Figure 2-9. Based on Table 3.4-2 and information in Section 3,a it appears that 12.86 acres of restored riparian habitat will be provided "on-site" ata Site 2-1. An additional 8.1 acres of restored riparian habitat is also proposed,a along with 4.81 acres of native grassland and 3.51 acres of "Other" habitat.a
    a. Table 2.1 shows 12.88 plantable acres for the three "off-site" mitigation areas, and Figures 2-9 a, b and c, show 15.14 plantable acres for the same mitigation sites. However, it appears 16.42 acres of off-site habitat restoration is being proposed.
    b. It is not clear what kind of habitat is proposed under "Other" to restore 3.51 acres due to impacts to "unvegetated" habitat. Native grasslands/forbs would appear to be appropriate.a
    c. Page 3-33 indicates that 8.10 acres of off-site riparian habitat will be restored at a mitigation site in the Lower American River Parkwaya (Parkway) to be selected and designed in coordination with NMFS and

7-1

USFWS as part of the consultation under the Endangered Species Act and would be located below the Ordinary High Water Mark (OHWM). If this mitigation will not be occurring at the off-site mitigation areas shown on Figure 2-9, then this mitigation site should be added to the project description and fully evaluated in the supplemental environmental documents.

d. Table 3.4-2 shows 6.85 acres of habitat being impacted within the Temporary Project Area, but no restored habitat is clearly identified to address these impacts. Show at least 1:1 mitigation and provide locations and specific establishment protocols, performance standards, and monitoring for this restored habitat.

7-1 (cont.)

2. More detail is needed on the proposed on-site and off-site mitigation sites. There is no detailed description of the proposed "off-site" mitigation sites, including criteria for site selection, and other relevant information including vegetation surveys, soils and drainage information and the location of the sites relative to the OHWM. Indicate how these mitigation sites relate to the analyses and recommendations of the County's proposed Natural Resources Management Plan.

7-2

3. Develop a Habitat Restoration Plan for the project mitigation plantings to be reviewed and approved by an appropropriate advisory group focused on American River natural resources issues such as the Lower American River Task Force. At a minimum, the plan should include the following:
   a. Define a desired goal state (e.g. plant species composition and structure) for each habitat type and location. Plant species and habitat design should be based on appropriate plant groupings and community associations and must consider restoration site conditions based on relevant site factors including soil conditions, topography, hydrology, groundwater levels, existing ecological communities (including exotic plant species), prior disturbances, and microclimates. Site-specific information should be used along with information developed for the County's proposed Natural Resources Management Plan.
   b. For each habitat type the proposed design should consider resource requirements for target species over space and time; structural habitat complexity; minimum patch size; and the proximity to, and connectivity

7-3

with adjacent habitat in the Parkway. Incorporate the needs of a range of species from different functional groups and "keystone species" to provide functional self-sustaining habitat that is resilient to disturbances and that can prevent or limit non-native weed species from colonizing and/or spreading on the site. Mosaics of structure and density in riparian restoration plantings should provide a range of nesting, foraging, and cover for wildlife. Grasslands habitat should include a variety of flowering forbs to encourage diverse native pollinators and insects.

c. Plants, cuttings, seedlings and seeds for restoration plantings should be obtained from ecotypes/ecoregions consistent with the proposed habitat types on the Parkway to ensure genetic suitability of the plantings, and should be grown without use of herbicides and pesticides, and with appropriate phytophthora controls. If suitable plantings are in short supply, consideration should be given to use of contract grows to assure adequate and appropriate quantity and sources of plantings for Contract 1 and subsequent American River mitigation plantings.

7-3 (cont.)

4. Performance Standards and Monitoring
   a. The Project Description and VEG-1 and VEG-2 Mitigation Measures must explicitly require compliance with the American River Common Features GRR Habitat Mitigation and Monitoring Plan (HMMP) that contains specific requirements for monitoring protocols and performance standards (success criteria) for each habitat type. The Riparian, SRA, Elderberry and Oak Woodland performance standards in the HMMP extend out to 5 years rather than 3 years shown in Table 2-5 of the Draft EA/EIR. The Project Description and Mitigation Measures should also indicate actions to be taken if performance standards are not met after 5 years and how ultimate achievement will be assured and documented. It is recommended that the monitoring period be extended an additional two years if performance standards are not met after 5 years.
   b. The HHMP (Table 9) provides Performance Standards for Riparian, Oak Woodland, and SRA habitats and indicates the "percent cover of non-native species" is to be less than 15%. For this project, it is also recommended that there be a list of invasive weed species for which there shall be zero tolerance during the performance period, to be accomplished

7-4

CALIFORNIA NATIVE PLANT SOCIETY
SACRAMENTO VALLEY CHAPTER

by periodic weeding as part of regular maintenance activities. The Cal-IPC list of invasive plants for the "Great Valley" appears to be an appropriate plant list.

7-4 (cont.)

5. Monitoring should be conducted not only to evaluate identified performance standards, but also to assess use of the restoration plantings by wildlife species. Biological monitoring should be conducted in Year 3 and Year 5 of the Project. This biological monitoring would be independent of the project performance standards and is intended to provide meaningful information on wildlife responses to the mitigation plantings, including use by target species of mammals, birds, insects and pollinators. This information will be useful in designing future mitigation sites on the Parkway and can provide the option for future monitoring by the long-term steward of the property. The Contractor shall provide a Final Biological Monitoring Report to Sacramento County and the U.S. Army Corps of Engineers at the conclusion of Year 5 that includes the biological monitoring plan objectives, methods, materials, results, recommendations, and as-built drawings of the final plantings and species compositions, along with information on additional plantings made to address performance standards. This plan should include documentation of monitoring plots and photo points across the mitigation sites that could be used for future monitoring, if desired.

7-5

6. Project Contract Bid specifications should include the following:
    a. Contractor must demonstrate at least five years prior experience designing, restoring, maintaining and monitoring wild native plant landscapes within sensitive resources in California. Contractor must have a qualified biologist supervise the day-to-day on-site habitat restoration, maintenance and monitoring activities.

7-6

To Whom It May Concern:

I have concerns regarding the recent addition of the Two Rivers Bike Trail to Project 2.1 up river of Paradise Bend. Twice, it's been relayed to me that the trail will use the maintenance road without fully answering my questions. I'm a member of the Bank Protection Working Group that has been briefed on the Project from its beginning until recently. While a bike trail was mentioned once by a group from the City, the proposal was to cut it into the levee, and that was was rejected. It now appears the bike trail is back and the proposal is for dual use of the maintenance road. This still leaves questions.

This area of the river has some of its fastest and highest flows, and during high water levels, models show these fast flows would reach high on the levee itself. The reach from the levee toe to the water is fairly narrow even during low flows. The current maintenance road is about the width of a small truck, but a bike trail with walking and jogging shoulders would be about 22 feet. Parts of the current maintenance road appear in fairly low areas and seem subject to flooding often with fast moving flows that would erode a bike trail. Additionally, even if a bike trail were to be placed high up on the levee, in this area it would have a steep slope to the river side, which would present a serious hazard to anyone riding, runner, or walker accidently moving in that direction. There's also the question regarding how much of an opportunity for planting benches is being sacrificed for the bike trail in this narrow section.

To be clear, I'm not against bike trails. I believe they are great. I'm just wondering if it's advisable to have one in this particular stretch of Parkway. However, the issues raised above need attention.

8-1

Sincerely,
Joseph E. O'Connor Jr.

Re: American River Contract 1 -- comments on the Revised DEIR

I am writing as a resident of the River Park neighborhood, the area closest to the Contract 1 project area.

My comments comprise three separate sections. The first section includes some of my questions and comments submitted at the Virtual Public Meeting on June 15 and re-submitted here. The second section is in support of and expanding upon the Save the American River Association (SARA) comment letter of July 16. The third section is one question regarding the phasing of this project and the project immediately across the River – roughly the area of the Campus Commons Golf Course.

Section One

1) Will access to Paradise Beach be affected? If so, will signage be placed at the entrances to River Park? 9-1

3) How will the haul routes and traffic impact be scheduled and coordinated with the community? Will coordination occur with the ongoing City of Sacramento Water Meter Installation Project? 9-2

4) Which parts of the project area will receive the launchable rock trenches and which part will receive the planting bench systems? Will these systems all be at the water's edge, or will the system be closer to the levee where the beach area is broad? 9-3

Section Two

These comments relate to the SARA letter of July 16

1) I strongly support the suggestion that the launchable rock toe be covered with soil (p. 2). This will minimize the esthetics of an artificial system of benches. 9-4
2) Staging area (p.2) Contractor must return the staging area to its prior condition, including removing any rock pads or other surface changes. This staging area is visible to anyone who comes over the levee and if it is left in a deteriorated state that will be unfortunate. 9-5
3) The proposed mitigation area near Paradise Beach (p. 3) at Glenn Hall Park provides an enormous opportunity for habitat restoration. However, it could just as easily become a nightmare of cross-trails, broken trees, and unsightly failed plantings. It is crucial that the County and the Corps at least discuss and hopefully coordinate the planting to integrate it into a 9-6

system that meets the strict standards in the Parkway Plan for this very vulnerable section of the Parkway. 9-6 (cont.)

Section Three

Phasing of Contract 1 and the Common Features project at the Campus Commons Golf Course.

Contract 1 is the first of the projects along the lower American River. Later, improvements will be made across the River by the Campus Commons Golf Course. As I understand it, that project has been designed to work in synch with Contract 1. Contract 1 will build out the launchable rock into the River, and the project across the River will compensate for that loss of channel.

However, there will be a time gap where Contract 1 will be complete and its opposite number will not yet be complete. If there is a high water event during this gap, there could be loss of Contract 1 improvements. This may not be a significant probability, but I am hoping it's been planned for. 9-7

Thank you so much for your work to make our neighborhood safer, and thanks for providing the opportunity to comment on this plan.

Sincerely,

Kate Riley

Subject: SEA/EIR for the American River Watershed Common Features Project, American River Contract 1

To Whom It May Concern,

Thank you for the opportunity to make the following comments on the above mentioned subject as it relates to the City of Sacramento's Two Rivers Trail project proposed for construction in the area of the levee improvements at Site 2.1 on the lower American River.

The USACE stated in all public workshops/meetings, when asked, that the Corps and the City of Sacramento are working together to ensure the coordination of each project as it relates to required mitigation for impacts to natural resources. However, the SEA/EIR provided no details regarding this cooperative planning. It would have been helpful to have a representative from the City of Sacramento participate in the public workshops in order to better understand how the two projects work together to successfully mitigate the loss of riparian habitat and conserve the replacement trees and vegetation. 10-1

Given the scale of the levee project, and the extensive widening and intensive new use of the current unpaved maintenance road, the SEA/EIR should provide an underlying map of the levee project with the Two Rivers Trail plan superimposed to better portray the relationship between the two projects and their impacts on the natural resources. 10-2

From the description of Fencing and Fire Breaks on 2-32 in the SEA/EIR, it is unclear whether the 7.75 acre mitigation site RM 4.9 will be fenced entirely for the 3 growing seasons following the initial planting installation period. It should be entirely fenced given the mitigation site's proximity to a heavily use area of the Parkway by residents and visitors alike. Paradise Beach and the surrounding areas are especially plagued by off-leash dogs and off paved trail cycling. Users crisscross these areas with many rogue trails looking for easy access. 10-3

While the SEA/EIR under 2.3.6 Operations and Maintenance describes the levee project's less than significant impacts on the Two Rivers Trail (currently unpaved maintenance road), it does not describe the cumulative impacts of the operations and maintenance activities by the City of Sacramento and the American River Flood Control District. The unpaved maintenance road, soon to be the Two Rivers Trail, needs a comprehensive management plan between the City of Sacramento, the American River Flood Control District, and the USACE to avoid potentially dangerous interactions with bicyclists and pedestrians, and to coordinate riparian habitat management. The flood control district is unwavering in its assertion that user interactions are hazardous and they are ineffectual in eliminating these hazards with safety procedures. The City of Sacramento will be assuming the responsibility for keeping the paved bicycle trail free of unsafe conditions caused by degradation of the pavement, encroaching 10-4

vegetation, diseased and dying tree limbs, trash, etc. As stated in the SEA/EIR, the USACE will be monitoring for a five-year establishment period, using the Two Rivers Trail for inspections, weed abatement, removal of encroachments, and high-hazard vegetation to ensure levee integrity and adequate levee access along the levee toe road, etc. Without an integrated plan, the riparian habitats adjacent to the Two Rivers Trail will be subject to three entities' separate operations and management actions, leaving them vulnerable to degradation, and as we sometimes observe in the Parkway, elimination.

10-4 (cont.)

During the five-year establishment period will the USACE be responsible for the removal of illegal camps and trash abatement in the project area?

During the five-year establishment period will the USACE be responsible for enforcing actions that threaten the mitigation site RM.9 in particular?

10-5

And finally, through the SEA/EIR, will USACE please confirm their commitment to not moving forward with the tree and vegetation removal if the construction phase is delayed.

10-6

I would like to sincerely thank Mr. Patrick Caden, Project Manager, and his team for the unstinting time they gave to the public through workshops and meetings to help stakeholders better understand this important but impactful levee project. They managed, despite Covid-19, to respond to everyone's requests for help understanding complicated levee engineering and natural resources mitigation solutions. It cannot be overstated that the Corps, through the Bank Protection Working Group, and public workshops, has made every effort to work with the Sacramento community to achieve flood protection while respecting the priceless American River Parkway.

Sincerely,

Betsy Weiland

Subject: American River Contract 1: Draft Supplemental Environmental Assessment/Supplemental Environmental Impact Report

To Whom It May Concern:

These are the comments of the Save the American River Association (SARA) on the Draft American River Watershed Common Features, Water Resource Development Act of 2016, American River Contract 1: Supplemental Environmental Assessment/Supplemental Environmental Impact Report (DSEA/SEIR) dated June 2020.

On the whole we are pleased with the design of the project being proposed. We compliment the U.S. Army Corps of Engineers (USACE), the Lower American River Task Force Bank Protection Working Group (BPWG), and the various agencies, non-governmental organizations, and interested individuals in the BPWG for a good job.

However, we do have one significant recommendation for improvement of the project design. Also, we have some comments on the DSEA/SEIR itself.

Recommendation for Improvement

The design of the Planting Bench segment of the project, as shown in Figures 2-6d and 2-6e, has the rock levee and bank protection covered with soil and vegetated. Covering with soil and vegetation is a very important feature with many benefits. However, the launchable rock toe is apparently not covered with soil. We note in particular that on p. 2-14 it states that: "The launchable rock toe would be filled with maximum 36-inch rock only." However, somewhat later on it states that: "The launchable toe would be buried, if needed, to reduce the hydraulic impacts of rock projecting

11-1

into the main channel." On p. 3-14, it states that: "Comparison of the existing and Proposed Action conditions shows that construction of the levee improvements at Site 2-1 would cause a rise in water surface elevations upstream of the project site to the upstream end of the leveed reach. The rise is due to the placement of rock along the toe at Site 2-1 as part of the design." Further on it indicates that the rise at 160,000 or 115,000 cfs would be around 0.2 feet initially and 0.4 feet as the vegetation matures.

Our recommendation is that the launchable rock toe should be covered with soil as is suggested on p. 2-14. This would reduce the rise in water surface elevations under flood conditions and be valuable from an esthetic viewpoint. Reducing the rise in flood water surface elevation would give greater flexibility to other parts of the flood protection work that are still in design stages. Large, angular rock (to 36 inches) is obviously unnatural at that position in the river channel, and would likely be exposed in some months of some years. This would permanently detract from the appearance of the project for people on the opposite shoreline as well as recreationalists on the river itself. If the rock is not to be covered with soil, an explanation of why should be part of the final environmental documents.

11-1 (cont.)

Comments

p. 1-1:
The second paragraph discusses the 1985 American River Parkway Plan as well as the 2002 Lower American River Corridor Management Plan. The latter is indicated as intended to serve as a "catalyst" for updating the 1985 Parkway Plan. It is odd that the more recent 2008 Parkway Plan is not mentioned here, although it is cited on subsequent pages (e.g. p. 2-33).

11-2

Figures 2-4a and 2-4b
There are efforts underway to extend the Two Rivers bike trail into the area of the proposed project. It is our understanding that the current concept is to utilize the existing maintenance road shown in Figures 2-4a and 2-4b. However, this raises some questions that were not addressed in the DSEA/SEIR. First, on site measurements show the maintenance road to be about 6 to 7 feet wide. However, bike trails are usually considerably wider, perhaps as much as 22 feet, including walking paths on either side. How is this to be accommodated? What effects would this have on project performance (e.g. would it increase the elevation of the river under flood conditions)? Also, how often are river levels expected to inundate the proposed bike trail? Can you provide cross-sectional diagrams comparing the elevation of the river flows in comparison to the proposed bike trail?

11-3

Figure 2-3 and p. 2-25:
On Figure 2-3, there is a staging area of some size proposed inside the Parkway downstream from the launchable rock project area. As discussed on p. 2-25, "Any staging area would be restored to pre-existing contour and condition or as agreed to by the property owner."

11-4

Previous experience with a staging area inside the Parkway serves as a cautionary example. Specifically, the Kansas Access staging area for the Mayhew-Gristmill levee raise and widening around 2008 is problematic. The contractor laid down a construction pad composed of compacted clay and rocky fill, which was up to 20 inches deep at the downstream end. This created a very hard and impermeable layer. However, the contractor refused to remove the pad when the project was completed. Apparently, the contractor asserted that no survey of the area was completed prior to constructing the pad, and said the pad did not exist. Most of the pad remains to this day. The result has been that revegetation has been marginal at best in this area, remaining sparse and stunted compared to adjacent areas. Recently (in the last few years), Yellow Starthistle has managed to grow fairly well. However, this is not a desirable outcome.

The USACE and any other parties involved should require a survey of the staging area to establish the pre-existiug contour before construction commences.

11-4 (cont.)

p. 2-27
The first paragraph states: "If desired transplantation sites in the American River Parkway cannot be identified in coordination with the County of Sacramento prior to start of levee construction, or if County of Sacramento approvals caunot be acquired, USACE would find a USFWS-approved conservation bank that is accepting elderberry shrubs."

As it is more ecologically advantageous to the Parkway for mitigation transplanting to he within the Parkway, we would like to encourage appropriate efforts are made to locate suitable sites and obtain approvals prior to start of work.

11-5

p. 2-27
Paragraph 3 states: "Each mitigation site would require temporary access for initial ground preparation and mitigation site establishment activities with permanent access for long-term maintenance. Temporary activities include access to the river for irrigation water and deer fence installation, which would only be required during the establishment period. Maintenance activities are explained further below. A temporary staging area would also be established to house an 8-foot by 16-foot storage container, a portable toilet, and a wash station at each." (Emphasis added.)

If possible, the temporary and permanent access should be the same to minimize disturbance to habitat. All temporary disturbance to land or vegetation should be restored to an undisturbed, natural condition.

11-6

Figures 2-9a, 2-9 b and 2-19c
Efforts should be made to ensure that habitat adjacent to mitigation sites that are currently un-impacted by a lot of human use aren't left with trails or new access that

11-7

will encourage increased use and impacts to mitigation. (E.g., Rio Americana West Mitigation Site.)

11-7 (cont.)

Figure 2-9a
The Glenn Hall mitigation site, with 7.7 plantable acres, is well-chosen for mitigation based on its size and the adjacent downriver habitat. If successful, it will contribute to an already well-vegetated contiguous stretch of habitat at that location, which will provide for wildlife movement, protective cover, and breeding habitat for a diversity of species. If well-managed during and after its establishment, it has potential to be restored to and function as a healthy ecosystem where wildlife and natural processes can thrive.

Because of it's location immediately adjacent to heavily used Paradise Beach, it will require educational, interpretive signage, a clearly marked and delineated main trail, and, where needed to prevent random cross trail-creation, creation of a couple of cross trails to the destinations between what were several trails.

11-8

Other management strategies and monitoring may need to be employed to protect the restored habitat, such as removal or conversion of features that serve as attractions (e.g. removal of logs and rocks that can serve as seats to locations on Paradise Beach). Also, species such as California rose and blackberry and wild grape can be planted throughout, which could discourage travel off trail. Adjacent riverside beach areas can be densely planted with willows, alders, California blackberry and sycamore to protect the mitigation area from overuse. See figure.

Glenn Hall Park mitigation area

p. 2-32
Paragraph 4 (Elderberry transplanting) states: "The rows would undulate to make the plantings appear more natural, rather than having the appearance of an orchard." (Emphasis added)

Because of the high recreational use of Paradise Beach and current disturbance of the site, in order to help give the mitigation a greater opportunity for long-term success, it is suggested to strategically and naturally (i.e., strategic randomness) arrange the elderberry and other mid-high canopy riparian species, such that frequent users of Paradise Beach who used the site as a travel-way, won't habitually take that route and begin the re-creation of those trails.

Non-vegetated 'lines' tend to be followed as pathways and would be best avoided in the vegetation layout. A suggested approach for breaking up any "lines" would be to densely plant riparian scrub species and forbs throughout and under the existing and future gaps (when plants mature) in the canopy between the mid-high canopy species, as densely as the site's growing conditions and requirements for each species allows, plant low-mid canopy scrub species, which couldn't be simply stepped over. The goal would be to make it inconvenient to go off the main trail or any established offshoots, and to discourage use of beach areas in the mitigation site.

A disturbed patchwork, akin to the current condition, is less beneficial to the diversity of wildlife species that would otherwise be present throughout their life cycles. Complex, multi-layered vegetation and protected wildlife movement corridors, are also required. The vegetation layers needed for wildlife movement depends on the species, e.g., low ground cover that is a couple to few inches high is needed by rodents and reptiles, whereas medium-sized mammals like rabbits, hares, skunks, and others, require medium shrubs. Avian species like California quail and California towhees, and dark-eyed juncos use this cover for safety and finding food.

11-9

p. 2-33
In paragraph 4, it states: "...general clean-up maintenance of the sites would occur throughout the year, clean-up maintenance would generally include picking up trash, vandalism repairs, and the removal of used planting accessories (e.g., bamboo stakes, ties, browse guards). For watering maintenance, crews would connect the pump to the irrigation system for each irrigation cycle per the irrigation schedule described in Table 2-5. Crews would weed within the watering basins of the transplants and within an 18-inch readius of each woody and grass associated plant, so nonnative herbaceous growth would not compete for soil moisture per the schedule in Table 2-5. Maintenance crews would mow weeds to below six inches...."

11-10

Efforts should be made during maintenance to avoid creating habitual trails and compacted soil around and between maintained plantings, by using different approaches and by gently "fluffing soil" and lifting upright the plants compressed underfoot. The goal is to leave little evidence of paths to, from, and around the site and its mitigation plantings, which could attract continued use when the fencing comes down and lead to disturbance of and reduction in vegetation, ultimately returning the site to a disturbed state.

11-10 (cont.)

p. 3-32, Table 3.4-2
Table 3.4-2, Existing and Restored Habitat at Site 2-1, provides extensive and informative information on the habitat types at the main project site that would be lost and gained due to the project. However, there are proposed to be three off-site mitigation areas (Figures 2-9a, 2-9b, and 2-9c, also Table 2-4) that would also be impacted, and presumably have losses and gains of various types of vegetation. No table comparable to 3.4-2 was provided for these off-site areas. As planting plans do not appear to have been created for these areas, at least a table with types of vegetation that currently exist in these areas should be provided. Our concern here is that the grassland habitat type may be slated to be lost by conversion to scrub or woodland. As the DSEA/SEIR correctly points out, this habitat type is quite valuable (p. 3-19 to 3-20). It may be that the loss of this habitat type would be something that needs to be mitigated in it's own right.

11-11

p. 3-32
On p. 3-32 it states that Valley Elderberry Longhorn Beetle (VELB) habitat lost would be replaced at a 3:1 (replaced:original) ratio, and that Yellow Billed Cuckoo habitat lost would be replaced on a 2:1 ratio. No basis for selecting these ratios was given. What is the basis for this selection?

11-12

p. 3-37
Paragraph 3 states: "In summary, to address the impacts on the 10.43 acres of riparian habitat (including forested wetland below OHWM) that would be affected by construction of the Proposed Action, replacement riparian habitat would be created, including 12.84 acres on site and 8.10 acres off site. Implementing this compensatory mitigation would reduce long-term impacts on any natural community or wildlife habitat within the Project Area to a less-than-significant level by creating on-site and off-site riparian habitat. Short-term impacts on vegetation and wildlife habitat would remain significant and unavoidable, because it would take a number of years (e.g., 10–15 years) for riparian habitat to become fully mature and provide the same values as existing riparian habitat." (Emphasis added.)

Because of the 10-15 or more years of delay in the full and intended performance of the replaced riparian habitat, we would be interested in exploring with you the palette of species you are considering and based on that, if applicable, looking at the

11-13

availability and feasibility of options that in the interim could reduce or help offset the delay to full maturity and value.

11-13 (cont.)

p. 3-37
Paragraph 4 states: "In addition, because impacts on migratory and movement conditions for terrestrial wildlife would be minor or temporary in duration and mitigated by on-site replacement, off-site mitigation, the impacts on the quality or quantity of important habitat, or access to such habitat for wildlife species, would be less than significant with on-site and off-site mitigation, and no additional mitigation measures are necessary."

It should be noted that impacts on movement conditions and access to customary habitat can cost an individual a generation of recruitment. As would be expected, there is greater impact for sensitive or listed species.

One such species is the western pond turtle, a California sensitive species. If a western pond turtle loses access for movement between her river habitat and her upland habitat during breeding season, she may lose the ability to excavate and lay her eggs, or she may be unable to return to the river, putting her life in danger. The high mortality rate for hatchlings is a major factor in recruitment, which will negatively impact the species by its inability to access its habitat.

Our suggested mitigation is that in project locations where western pond turtles have been observed or determined to be likely, and where there is upland habitat suitable for excavation, a biological monitor should check the upland area daily for turtles that may be headed back to the river so that they may be relocated.

11-14

p. 3-63
On p. 3-63 there is a reference to Table 3.6-3, which is described as showing a loss of 10.43 acres of riparian habitat on the proposed project site. However, Table 3.6-3 does not exist. It is also curious that table 3.6-3 was omitted from the Table of Contents. This would be a useful table to put back in.

11-15

p. 3-88 to 3-89
On p. 3-88 to 3-89 three additional mitigation measures are described (BATS-1, BADGER-1 and BEE-1) that go beyond the previous measures described in the USACE's General Reevaluation Report. These measures are described as being the responsibility of the Central Valley Flood Protection Board. Why are these measures not the responsibility of the USACE?

11-16

p. 3-121
Paragraph 2 states: "Implementation of the mitigation measures contained in the ARCF GRR FEIS/EIR would reduce construction-generated NOX emissions to a less-than-significant level that would not result in adverse health effects (as was shown in the HRA). In addition, with incorporation of dust control measures, PM (fugitive

11-17

dust) emissions would be further reduced (i.e., by up to 75 percent) and would not exceed applicable SMAQMD thresholds or result in adverse health effects."

Sensitive receptors include wildlife--avian, terrestrial and aquatic--in addition to the people of Sacramento. None of the mitigation measures for reducing air pollution during construction requires the limiting of engine idling, though it is required by SMAQMD regulations. Please include the limiting of engine idling as an air quality mitigation measure and to the P S & Es (Project Specifications & Estimates), if not already there, and stipulate that the project manager informs the workers and enforces it.

11-17 (cont.)

p. 3-140
Paragraph 3 states as a noise mitigation measure: "Limit unnecessary engine idling (i.e., longer than 5 minutes) as required by State air quality regulations."

Sensitive receptors include wildlife--avian, terrestrial and aquatic--in addition to the people of Sacramento. The limiting of engine idling is cited as a noise mitigation and it references SMAQMD regulations, but is not an included mitigation measure under Air Quality. It is requested that it be added as a mitigation measure under both categories.

Thank you for your attention to the above recommendation and comments.

Ron Stork, Friends of the River

Letter 1: California State Lands Commission

1-1 The Department of Water Resources will continue to work with the State Lands Commission to acquire a lease for lands in the Project Area within the Commission's jurisdiction.

1-2 As stated on pages 2-20 and 2-21 in Chapter 2, *Alternatives* of the Draft Supplemental EA/EIR, the design of the Proposed Action would allow recreational users of the river to use shore access and would not impede or restrict use of the river by recreationists, except in areas of active temporary construction activities along the shore. The Draft Supplemental EA/EIR also provides analysis of effects on recreation on pages 3-144 to 3-145 in Chapter 3, *Affected Environment and Environmental Consequences*, and includes mitigation measures to reduce impacts on recreation facilities by, among other measures, coordinating with user groups within the American River Parkway (Parkway), including those using the river. While the Draft Supplemental EA/EIR concludes that temporary construction impacts would be significant and unavoidable, navigation within the American River outside of the active construction zone would not be impeded or restricted by the Proposed Action.

1-3 In response to the comment, text on page 2-7, paragraph two in Chapter 2, *Alternatives* of the Draft Supplemental EA/EIR has been revised.

To clarify, the summer mean water surface elevation is not the same as the Ordinary Low Water Mark. The term OLWM is used solely for tidally influenced submerged lands, and the American River adjacent to the Project Area is not tidally influenced.

1-4 The California State Lands Commission will be provided a copy of the Final Identification and Evaluation Report and Monitoring and Discovery Plan along with proof of the State Historic Preservation Officer concurrence once that has been received by the U.S. Army Corps of Engineers (USACE) and Central Valley Flood Protection Board (CVFPB).

1-5 The ARCF Historic Properties Management Plan (HPMP) and ARCF Programmatic Agreement (PA) describe the procedures that will be followed by the USACE and CVFPB in case any cultural resources are discovered during the construction the proposed action, including coordination with the land owner. Mitigation Measures CR-2 and CR-4 on pages 3-96 and 3-97 in Chapter 3, *Affected Environment and Environmental Consequences* refer to and rely on these documents.

The USACE and CVFPB are aware that title to all archaeological sites, and historic or cultural resources are vested in the landowner, which for submerged lands of California is the State and they are also aware that those lands are under

the jurisdiction of the California State Lands Commission (the Project Area does not include any tide lands).

Further, the USACE and CVFPB are also aware that the final disposition of archaeological, historical, and paleontological resources recovered must be approved by the landowner, which on State lands under the jurisdiction of the California State Lands Commission must be approved by the Commission. If during construction of the Proposed Action any cultural resources would be discovered on State lands, the California State Lands Commission's staff attorney will be contacted. The USACE and CVFPB appreciate that the Commission has provided the contact information for their attorney for this purpose. There is no need to revise the mitigation measures to cite the Public Resources Code.

1-6 Climate change is discussed in Section 3.10, *Greenhouse Gas Emissions and Energy Consumption* of the Draft Supplemental EA/EIR. As described on pages 3-129 and 3-130, construction-related greenhouse gas (GHG) emissions would constitute a potentially significant climate change impact. However, the Proposed Action would increase the likelihood that the flood management system could accommodate future flood events as a result of climate change and would improve the resiliency of the levee system with respect to changing climatic conditions, potentially reducing exposure of property or persons to the effects of climate change. Nevertheless, because the Proposed Action would exceed SMAQMD GHG thresholds, climate change impacts would be significant. Implementation of Mitigation Measure GHG-1: Avoid, Minimize, and Compensate for Greenhouse Gas Emissions Effects, would reduce impacts attributed to increased GHG emissions to a less than significant level. Further, the design of the Proposed Action includes river flows that are regulated upstream at Folsom Dam at a maximum rate of 160,000 cubic feet per second. These maximum flows are the result of recent improvements at the dam to increase storage and controlled releases of flows during storm events that are forecasted with future potential climate change events included in the design and operation of the dam. See pages 3-9 to 3-14 in Chapter 3, *Affected Environment and Environmental Consequences* of the Draft Supplemental EA/EIR for the analysis of effects related to the design of the Proposed Action to meet safety criteria for maximum regulated flows.

1-7 As shown on figures in Chapter 2, *Alternatives*, the footprint of the Proposed Action only encroaches minimally on the channel of the American River. Therefore, boaters would have access past the Project Area during construction activities.

1-8 This comment is noted.

Letter 2: Sacramento Metropolitan Air Quality Management District

2-1 Comment noted. Please see response 2-2.

2-2 As stated on page 2-22 in Chapter 2, *Alternatives* and on page 3-113 in Chapter 3, *Affected Environment and Environmental Consequences* requirements included in Measures 3 and 4 of the GRR General Conformity Determination are Project commitments and would be enforced through construction contractor bid specifications. Because these measures are part of the Project, they were considered in the air emissions modeling. Therefore, duplicating these measures as mitigation in the Draft Supplemental EA/EIR is not necessary.

2-3 In response to the comment, pages 3-117 and 3-120 in Chapter 3, *Affected Environment and Environmental Consequences* of the Draft Supplemental EA/EIR have been revised.

2-4 In response to the comment, Mitigation Measure AQ-3 on page 3-120 in Chapter 3, *Affected Environment and Environmental Consequences* of the Draft Supplemental EA/EIR has been revised.

2-5 In response to the comment, text on pages 3-111, 3-113, 3-116, and 3-128 in Chapter 3, *Affected Environment and Environmental Consequences* of the Draft Supplemental EA/EIR have been revised. In addition, Table 3.9-1 on page 3-116 in Chapter 3, *Affected Environment and Environmental Consequences* of the Supplemental EA/EIR has been revised to indicate that PM10 and PM2.5 thresholds of zero pounds/day were exceeded.

2-6 Comment noted.

Letter 3: Central Valley Regional Water Quality Control Board

3-1 The comment recommends including turbidity language from section 3.1.21 of the Basin Plan specific to Folsom Lake and the lower American River that addresses dredging operations to Mitigation Measure WQ-1. The Proposed Action would not involve any dredging activities, however, so no changes to Mitigation Measure WQ-1 are required. The Proposed Action would involve work below the ordinary high water mark (OHWM) that would result in increases in turbidity. The Corps and CVFPB will apply for and comply with all required conditions of a Water Quality Certification under Section 401 of the Clean Water Act.

3-2 This comment is noted. It describes the Basin Plan and regulatory permits under the purview of the CVRWQCB to protect receiving water quality. Chapter 5 of the ARCF GRR FEIS/FEIR summarizes the environmental laws and regulations that apply to the ARCF Project and describes the status of compliance with those laws and regulations. Section 3.3, *Hydrology and Water Quality* of the Draft Supplemental EA/EIR, lists additional applicable laws and regulations which are

described in Chapter 5, *Compliance with Federal and State Laws and Regulations*. Implementation of the Proposed Action will comply with all applicable laws and regulations.

Letter 4: Sacramento County Department of Regional Parks

4-1 The USACE, the CVFPB, and Sacramento Area Flood Control Agency (SAFCA) would ensure that signage would be posted along the Parkway to alert users of the Parkway and neighboring communities prior to commencement of activities for the Proposed Action. Publication of the Draft Supplemental EA/EIR was noticed in the Sacramento Bee, in postcards sent to neighboring communities, and on the USACE website, as stated in the comment and as documented in Chapter 6, *Coordination and Review* of the Draft Supplemental EA/EIR. Appendix J summarizes the public involvement efforts for the Proposed Action.

The USACE and CVFPB would replace the maintenance road in-kind, no improvements to the maintenance road have been authorized as part of the Project.

4-2 As stated on pages 3-145 and 3-146 in Chapter 3, *Affected Environment and Environmental Consequences* of the Draft Supplemental EA/EIR, the Proposed Action would provide notices of trail closures and use traffic controls such as flag persons where construction traffic crosses the trail. Construction traffic would make use of maintenance roads when feasible. Use of paved trails, the levee crowns, and/or maintenance roads by the public during construction would be allowed only if conditions are safe enough for recreation use. In addition, public access would be returned once construction activities are completed and prior to planting. Mitigation Measure REC-1 on page 3-145 of the Supplemental EA/EIR has been modified to state that closure of paved trails would be noticed 14 days in advance via signage at the detour locations.

4-3 After the Proposed Action is completed, the operation and maintenance (O&M) of Site 2-1 (Project Area) would be conducted by the local maintaining agency (American River Flood Control District) according to an updated O&M Manual that would be prepared by the USACE. In the very unlikely event that the launchable rock toe would launch, repairs would be made to meet the flood protection criteria according to the O&M Manual. Repair of the planting bench or mitigation plantings would likely not be prescribed by the O&M Manual.

4-4 The Supplemental EA/EIR has been revised to replace Sacramento Department of Parks and Recreation with Sacramento County Department of Regional Parks.

Letter 5: Sacramento County Department of Regional Parks

5-1 See response 4-1.

5-2 See response 4-2.

5-3 See response 4-3.

5-4 See response 4-4.

Letter 6: Sacramento Municipal Utility District

6-1 As described in Section 3.13 *Public Utilities and Service Systems* on page 3-148 of the Draft Supplemental EA/EIR, analysis of potential adverse effects to existing utility infrastructure, including overhead electrical lines and buried infrastructure was evaluated in Section 3.16 of the ARCF GRR FEIS/FEIR (pages 317 through 323). Existing utilities that are functional and operational would be relocated accordingly. Mitigation Measure UTIL-1: Avoid and Minimize Service Disruptions and Damage to Utilities and Infrastructure would ensure that before construction begins, measures would be implemented to avoid and minimize potential damage to utilities and infrastructure, including electrical overhead and/or underground transmission and distribution lines, and to reduce service disruptions during construction. As further described in Mitigation Measure UTIL-1, all applicable utility and service providers would be coordinated with to implement the orderly relocation of utilities that need to be removed or relocated.

6-2 See response 6-1 for discussion of utility removal and/or relocation.

Related to electrical load needs and energy efficiency, as described on pages 3-129 and 3-130, implementation of the Proposed Action would result in an increase in fuel consumption as compared to baseline conditions. The analysis concluded that construction-related fuel consumption would be met through existing fueling infrastructure and would not be considered wasteful, inefficient, or unnecessary. Furthermore, the Proposed Action would not prevent the implementation of goals, policies, or actions contained in a plan to increase renewable energy usage or improve energy efficiency. The Proposed Action involves construction and maintenance of a project that would not generate operational electricity demand. Therefore, energy-related impacts would be less than significant.

6-3 Climate change is discussed in Section 3.10 *Greenhouse Gas Emissions and Energy Consumption* of the Draft Supplemental EA/EIR. As described on pages 3-129 and 3-130, construction-related GHG emissions would constitute a potentially significant climate change impact. However, the Proposed Action would increase the likelihood that the flood management system could accommodate future flood events as a result of climate change and would improve

the resiliency of the levee system with respect to changing climatic conditions, potentially reducing exposure of property or persons to the effects of climate change. Nevertheless, because the Proposed Action would exceed SMAQMD GHG thresholds, climate change impacts would be significant. Implementation of Mitigation Measure GHG-1: Avoid, Minimize, and Compensate for Greenhouse Gas Emissions Effects, would reduce impacts attributed to increased GHG emissions to a less than significant level.

6-4 Cumulative impacts are addressed in Chapter 4, *Cumulative and Growth Inducing Effects* of the Draft Supplemental EA/EIR. Specifically, cumulative energy use is described in Section 4.2.9, *Greenhouse Gas Emissions and Energy Consumption*; and potential disruption to utilities is described in Section 4.2.12, *Public Utilities and Service Systems*. In both cases, the Proposed Action would not result in a considerable incremental contribution to a significant cumulative effect.

6-5 See responses 6-1 and 6-6.

6-6 This comment is noted. As explained in response 6-1, USACE would coordinate with all applicable utility and service providers in order to ensure the orderly relocation of utilities that need to be removed or relocated. USACE is currently working with SMUD to obtain maps of all existing utilities and will continue to coordinate with SMUD on maintaining all safety clearances and on any relocations required for construction.

6-7 This comment is noted. As explained in responses 6-1 and 6-6, all applicable utility and service providers would be coordinated with to implement the orderly relocation of utilities that need to be removed or relocated.

6-8 This comment is noted. As explained in responses 6-1 and 6-6, all applicable utility and service providers, including SMUD, would be coordinated with to implement the orderly relocation of utilities that need to be removed or relocated.

Letter 7: California Native Plant Society Sacramento Valley Chapter

7-1 The following response addresses the comment on habitat restoration, and includes minor updates to impact and mitigation acreages resulting from design refinements.

Item 1a. Table 2-4 (referenced as Table 2-1 in the comment) shows 12.88 plantable acres for the three "off-site" mitigation areas. This acreage has since been modified as part of the design process and is now 10.47 plantable acres. A revised Table 2-4 has been provided in on page 2-27, and Figures 2-9 a, b, and c (pages 2-29 – 2-31) have also been revised to reflect this change.

The total proposed off-site riparian restoration is 10.47 acres as shown in revised Table 2-4 (previously 12.88 acres). Of that 10.47 acres, 8.0 acres would be used

to compensate for impacts to riparian habitat from construction activities at Site 2-1. The 4.81 acres of herbaceous vegetation (4.69 acres of native grassland and 0.12 acres of emergent wetland) and 3.51 acres of unvegetated area, referred to by the commenter, are proposed for on-site restoration and not off-site mitigation, and are included in the acreages in Table 3.4-2 for on-site restoration.

Item 1b. Unvegetated area refers to areas of sand and cobble. These areas are often associated with portions of the channel that experience high velocities during flows greater than a 2-year event and do not necessarily support vegetation. These areas would be restored to pre-construction conditions upon completion of the project.

Item 1c. The mitigation sites shown in Figure 2-9 and discussed in detail on pages 2-26 to 2-34 in section 2.3.7, *Mitigation Sites* of the Draft Supplemental EA/EIR, include three off-site mitigation sites that would be used to transplant elderberry shrubs and compensate for impacts to riparian and valley elderberry longhorn beetle habitat. There is a total of 10.47 acres available within the three sites for mitigation. Of those 10.47 acres, 8.0 acres would be used to compensate for impacts to riparian habitat associated with construction at Site 2-1. The remaining 2.47 acres would be used for future components of the ARCF GRR Project, as described in Mitigation Measure SRA-1 on page 3-87 of the Draft Supplemental EA/EIR.

As described in Table 3.4-2, on-site restoration occurs above and below the OHWM. The off-site locations occur above the OHWM. Additional off-site locations that would support shaded riverine aquatic (SRA) habitat are being pursued, but have yet to be specifically identified. Each mitigation site would undergo evaluation through the NEPA and CEQA process.

The text has been revised to clarify that the 8.10 (now 8.0) acres does not occur below the OHWM.

Item 1d. All 6.85 acres of habitat within the temporary work areas would be mitigated. Within the temporary work areas, 1.96 acres of riparian habitat would be impacted. This area has been included in the total 10.43 acres of riparian impacts (8.47 acres permanent erosion protection sites and 1.96 acres of temporary work areas). All riparian habitat impacts would be mitigated at a 2:1 ratio for a total of 20.86 acres. Approximately 2.34 acres of non-native annual grasslands would also be disturbed and would be restored with native grasslands as indicated on page 3-33. Although the activities in the temporary work areas would be temporary in nature, the removal of riparian habitat from these areas is assumed to be a permanent impact.

7-2 The Draft Supplemental EA/EIR includes a description of the off-site mitigation sites in Section 2.3.7, *Mitigation Sites* (pages 2-26 to 2-34). The Habitat Mitigation, Monitoring, and Adaptive Management Plan (HMMAMP) for the

ARCF GRR Project includes additional requirements that would be met by the off-site mitigation sites. The sites were selected by USACE, CVFPB, and SAFCA in coordination with the Sacramento County Department of Regional Parks for their suitability to provide riparian and elderberry shrub habitat and their compatibility with other Parkway uses. The USACE is a participant in the development of the American River Parkway Natural Resource Management Plan (NRMP), that is currently under development. Text was added to Section 2.3.7.1 on page 2-27 of the Draft Supplemental EA/EIR to explain why the sites were chosen and what their current habitat conditions are.

7-3 Restoration planning would follow the HMMAMP and would be consistent with the American River Parkway Plan.

Item 3a. The habitat goals are consistent in general terms with the HMMAMP performance standards and with the needs of the native species occurring in the American River Parkway, as described in the Draft Supplemental EA/EIR Sections 3.4, 3.5 and 3.6, and will meet the mitigation requirements for impacts to federally listed species, including yellow-billed cuckoo, valley elderberry longhorn beetle, and listed salmonids with potential to occur at Site 2-1, as will be included in the biological opinions to be issued by USFWS and NMFS for the Proposed Action.

The HMMAMP which includes conceptual mitigation proposals, performance standards, and adaptive management tasks was included in the original ARCF GRR FEIS/FEIR. The HMMAMP describes the types of habitats that would be impacted, the potential impacts caused by the project, and describes the types and amounts of mitigation that would be established in order to compensate for habitat losses. This plan also establishes a framework for the creation of mitigation sites and methods to evaluate the success of these sites in order to ensure that the goals and requirements of the Project's required mitigation are accomplished.

The USACE is a participant in the development of the American River Parkway Natural Resource Management Plan (NRMP), that is currently under development.

Item 3b. The HMMAMP along with the American River Parkway Plan are being used as guides to develop the site specific restoration and monitoring plans for Site 2-1 and the off-site mitigation sites. The restoration plans would also be consistent with the permits that will be obtained under Section 7 of the Endangered Species Act and Section 401 of the Clean Water Act.

Item 3c. Restoration plantings would be locally sourced from commercial native plants suppliers as much as feasible. Contract growing would be considered when needed.

7-4 The following response addresses performance standards and monitoring.

Item 4a. Both Mitigation Measures VEG-1 and VEG-2 state that both the on-site and replacement habitat would be created in accordance with the HMMAMP.

Table 2-5 in the Draft Supplemental EA/EIR is a maintenance schedule and was developed for conducting the first 3 years of maintenance activities by the USACE for transplanted elderberry shrubs. The site would be maintained and monitored according to the requirements of the HMMAMP and U.S. Fish and Wildlife Service (USFWS) Biological Opinion, until the performance standards provided in these documents are met.

Table 2-5 does not address the monitoring schedule for transplanted elderberry shrubs, riparian or other habitat restoration, or restored fish habitat. Mitigation Measure VELB-1 on page 3-77 in the Draft Supplemental EA/EIR, which refers back to the Framework for Assessing Impacts to the Valley Elderberry Longhorn Beetle (USFWS 2017), requires a minimum of 7 years of monitoring, and Mitigation Measure FISH-3 (on page 3-85) requires monitoring for 10 years after construction pursuant to the HMMAMP. Both Mitigation Measures as well as the HMMAMP incorporate adaptive management and require that additional monitoring would be required if established success criteria are not being met.

Item 4b. The performance standards for this project would comply with the HMMAMP as is stated in Mitigation Measures VEG-1 and VEG-2 on pages 3-35 and 3-36 of the Drfat Supplemental EA/EIR. Figures 3.4-1a –3.4-1c in the Draft Supplemental EA/EIR identify invasive plants and Table 3.4-1 identifies invasive plants on the California Invasive Plant Council (Cal-IPC) list. Chapter 5 in the Draft Supplemental EA/EIR (page 5-6) further addresses invasive species. The Draft Supplemental EA/EIR also addresses measures to prevent the spread of existing invasive species and introduction of new invasive species in Chapter 2, *Alternatives,* on pages 2-25 and 2-32.

7-5 See response 7-4 Item 4a. Monitoring will be conducted and annual reports will be prepared as indicated in the HMMAMP and to comply with the permits and authorizations that will be obtained for the project under Section 7 of the Endangered Species Act and Section 401 of the Clean Water Act. The annual reports would provide detailed notes on the biological conditions, monitoring objectives, methods, results (including photo documentation), and recommendations as needed. As-built drawings would be prepared and submitted to the permitting agencies as required by the HMMAMP and permits.

7-6 The bid specifications will incorporate mitigation measures identified in the Draft Supplemental EA/EIR, the ARCF GRR EIS/EIR, the HMMAMP, and as required by permits that authorize the Proposed Action.

Letter 8: Joseph E. O'Connor Jr.

8-1 As stated on page 2-20 in Chapter 2, *Alternatives,* of the Draft Supplemental EA/EIR, the Proposed Action would deconstruct the existing maintenance road and rebuild it to existing condition. The Proposed Action does not include the City of Sacramento's Two Rivers Trail project. See also response 4-1.

Letter 9: Kate Riley

9-1 As stated on page 3-145 in Chapter 3, *Affected Environment and Environmental Consequences* of the Draft Supplemental EA/EIR, as part of Mitigation Measure REC-1 signage would be installed at major entry points in the neighborhoods for the public to provide information on closures of entry/exit points and provide alternate access routes for those areas that would be affected by the Proposed Action, including bicycle routes. In addition, updates on closures and alternate routes would be provided on the USACE website for the Proposed Action. Construction of the Proposed Action would close entry to Paradise Beach at the Glenn Hall Park entrance for safety reasons. Access to Paradise Beach downstream and outside the construction zone would not be affected.

9-2 See Mitigation Measure TR-1 on pages 3-106 to 3-108 in Chapter 3, *Affected Environment and Environmental Consequences* of the Draft Supplemental EA/EIR for a description of measures to address traffic and circulation, including measures for pedestrians and bicyclists, during construction of the Proposed Action. Residents and travelers would be notified of traffic patterns and road closures at least one week prior to commencement of construction activities. In addition, updates on closures and alternate routes would be provided on the USACE website for the Proposed Action. USACE will also coordinate with the City of Sacramento on any projects that the City will be implementing that could interfere with the Proposed Action, including the City's installation of water meters.

9-3 Please see page 2-8 in Section 2.3.3 *Site Description* of the Draft Supplemental EA/EIR for descriptions of the launchable rock toe and planting benches and the locations of both of these components.

9-4 The launchable toe of the planting bench would be buried into the streambed along much of the site to reduce the visible rock along the shoreline. The amount of rock that is buried into the streambed was optimized to limit impacts to the natural streambed. The launchable toe was set at varying elevations, with the entire toe submerged at flows of 3,900 cfs and above, and portions of the bankline submerged for flows down to 800 cfs (see Figure 2-6e). Covering the launchable rock toe with soil would not be effective, because the exposed soil would be eroding from the rock toe due to passing river flows.

9-5 Please see page 2-25 in Chapter 2, *Alternatives* of the Draft Supplemental EA/EIR for a description of demobilization and cleanup of the Proposed Action site and associated staging areas.

9-6 Please see pages 2-32 and 2-33 in Chapter 2, *Alternatives* of the Draft Supplemental EA/EIR for a description of temporary fencing to be erected around planting sites and maintenance of planting sites, respectively.

9-7 Please see pages 3-9 through 3-14 in Chapter 3, *Affected Environment and Environmental Consequences* of the Draft Supplemental EA/EIR for the analysis of hydraulic effects of the Proposed Action relative to levee safety design criteria, including at high flow events.

Letter 10: Betsy Weiland

10-1 See responses 4-1 and 8-1.

10-2 See responses 4-1 and 8-1.

10-3 As stated on page 2-32 of the Draft Supplemental EA/EIR, a temporary fence would be installed at the perimeter boundary, surrounding the entire area of each mitigation site.

10-4 See responses 4-1 and 8-1. As stated on page 2-20 in Chapter 2, *Alternatives* of the Draft Supplemental EA/EIR operation and maintenance activities will occur as they are currently.

10-5 See response 10-3. See also page 2-33 in Chapter 2, *Alternatives* of the Draft Supplemental EA/EIR that states that maintenance would include picking up trash and making vandalism repairs. Removal of illegal camps or enforcement against actions that threaten mitigation sites are not within the jurisdiction of USACE, CVFPB, or SAFCA, but would be coordinated with the appropriate law enforcement entity (e.g., Sacramento County Department of Regional Parks wardens).

10-6 USACE would delay vegetation or tree removal if there were a delayed construction date.

Letter 11: Save the American River Association

11-1 See response 9-4.

In addition, it is noted that at typical summer water levels, approximately 6 inches of rock would be anticipated to be visible above the summer water level. The visible rock would be intermittent in length as the waterside toe undulates in

elevation above and below the summer water surface, and would be visible above the water level along approximately 30% of the shoreline.

Soil was not mixed into this matrix of rock as it would require mixing soil and rock below the ambient water surface elevation where much of the soil would likely be lost to the flow. Cofferdams and dewatering would likely not be allowed under permit requirements to dewater this area to place soil filled rock. Similarly, soil would be winnowed out of rock placed where it is typically exposed to currents.

Modeled hydraulic impacts were sensitive to Manning's *n* (hydraulic roughness) values of the rock bench, but soil fill would not significantly reduce the hydraulic impacts.

11-2 The text in the introduction of the Draft Supplemental EA/EIR identified by the comment is a historical perspective of events that began over 24 years ago, and included the development of the Lower American River Task Force efforts in preparing the Lower American River Corridor Management Plan that informed updating of the 1985 American River Parkway Plan. As the commenter states, the 2008 Parkway Plan is discussed in later sections of the Draft Supplemental EA/EIR.

11-3 The USACE would restore the maintenance road to a width of 16 feet, which is approximately equal to its current width. See responses 4-1 and 8-1. The Two Rivers Trail Phase II project was not analyzed in the Draft Supplemental EA/EIR, because it is not part of the Proposed Action; therefore, no hydraulic or other analysis was conducted related to the City's bike trail project.

11-4 Page 2-25 of the Draft Supplemental EA/EIR stated: "Any staging area would be restored to original pre-existing contour and condition or as agreed to by the property owner." USACE contract specifications require the Contractor to document pre-construction conditions with video and/or photographic records to compare pre- and post-construction conditions. The following sentence was also added: "Impacts to riparian habitat would be avoided to the extent feasible. Any unavoidable impact to riparian habitat would be mitigated off-site at ratios described in Chapter 3."

11-5 USACE would coordinate with Sacramento County Department of Regional Parks and USFWS to identify transplant sites within the Parkway. That would be the preferred option. However, if no opportunities for valley elderberry longhorn beetle mitigation in the Parkway would be available, USACE would work with USFWS to identify alternative opportunities.

11-6 As shown in Figures 2-9a, 2-9b, and 2-9c on pages 2-29 through 2-31 in Chapter 2, *Alternatives* of the Draft Supplemental EA/EIR, all temporary access routes are

the same as permanent access routes. See response to 11-4 regarding post-construction restoration of areas to original conditions.

11-7 The Proposed Action would not include maintenance of areas outside the easements acquired for implementation of the mitigation areas. See pages 2-33 and 2-34 in Chapter 2, *Alternatives* of the Draft Supplemental EA/EIR for information on the maintenance activities for the mitigation sites, including picking up trash and vandalism repairs.

11-8 This comment is noted. The Proposed Action would not include the creation of trails within the Glenn Hall mitigation site. The planting plan for the mitigation site will include a diversity of plant species, including the ones mentioned in the comment, that would discourage travel off trail. See also response 11-7.

11-9 The mitigation sites would be designed to optimize habitat for the valley elderberry longhorn beetle and its host plant the blue elderberry, consistent with the USFWS (2017) Mitigation Framework. Planting the elderberry shrubs together with other accompanying native riparian plant species ultimately will result in a complex multi-layered plant community. However, for successful elderberry shrub establishment, initially a relatively open canopy is required to provide sufficient sunlight and to allow for understory vegetation management, to reduce competition from non-native plants. During this initial establishment period the mitigation sites would be fenced, and would not be accessible to the public. After the establishment period vegetation becomes dense and attains a more complex canopy structure, fencing would be removed. Given the dense character of the vegetation following the establishment period, it is not likely that informal paths will be created.

11-10 Mitigation measures would be implemented consistent with the HMMAMP, American River Parkway Plan, Biological Opinions, and the NRMP, when it is adopted. The sites would be managed and maintained to leave them, after maintenance activities are completed, as natural as possible, and consistent with the guidance in those documents.

11-11 As stated, planting plans for the mitigation sites are still under development and will be approved as part of the Endangered Species Act Section 7 permitting process. Native species in shrub and woodland habitat would be protected and non-native species, including non-native grasslands, would be removed and replaced with native grasslands, scrub, and woodland habitat appropriate to each site. Text was added to Section 2.3.7.1 on page 2-27 of the Draft Supplemental EA/EIR to explain why the sites were chosen and what their current habitat conditions are.

While the majority of the area in these sites would be planted in native riparian scrub or woodland habitat, the planting plans would promote spatial and structural diversity of native riparian vegetation. For areas where elderberry shrubs would

be planted and/or transplanted, the USFWS guidelines specify that 1 other native riparian plant of a species that typically may co-occur with elderberry shrubs ("native associate") should be planted with every 3 elderberry shrubs to establish a diverse riparian canopy, but also to minimize interspecific competition for sunlight and water (USFWS 2017). Areas that will remain in grasslands would be planted with native grassland species, which would significantly increase the value over non-native grassland in both species diversity and food source for wildlife. Additionally, the herbaceous layer of the scrub and woodland planting areas would be seeded with native grassland species, where appropriate, to provide greater value grassland habitat. Thus, with the improved habitat values, the mitigation sites would create a net gain in habitat value to wildlife.

11-12 Mitigation ratios for these Federally listed species were determined by USFWS in consultation with the USACE under Section 7 of the Endangered Species Act.

11-13 Although it would take 10-15 years for riparian vegetation to become fully *mature*, the planted vegetation is expected to develop into a stand of shrubs and small trees within one or two years due to the rapid growth of early successional species (willows and Fremont cottonwood) in the planting mix. Mitigation sites would be planted in a manner consistent with the American River Parkway Plan, HMMAMP, USFWS and National Marine Fisheries Service (NMFS), and, when completed, the NRMP.

11-14 Mitigation Measure TURTLE-1 on pages 3-83 to 3-84 in Chapter 3, *Affected Environment and Environmental Consequences* of the Draft Supplemental EA/EIR, provides for a pre-construction survey by a qualified biologist, relocation of turtles, if any are found, and requires that if western pond turtles are found on land within the construction footprint during construction, the project activities would stop within 200 feet of the turtle and a qualified biologist would be notified immediately, and provides for relocation and coordination with California Department of Fish and Wildlife (CDFW) if necessary.

The mitigation measure also states that if a western pond turtle nest is unintentionally uncovered during project activities, work would stop in the vicinity of the nest and contacting of CDFW to determine the appropriate next steps.

11-15 The information referenced here (loss of riparian habitat) is provided in Table 3.4-2 in Chapter 3, *Affected Environment and Environmental Consequences* of the Draft Supplemental EA/EIR. The reference to Table 3.6-3 was in error and has been removed. If all of the riparian habitat impacts are added together for both permanent and temporary impacts above and below the ordinary high water mark, they total 10.43 acres. The text has been revised to direct readers to Table 3.4-2.

11-16 CVFPB was replaced with USACE and CVFPB.

11-17 Included in Mitigation Measures AQ-1 and GHG-1 on pages 3-119 and 3-131 in Chapter 3, *Affected Environment and Environmental Consequences* of the Draft Supplemental EA/EIR is a requirement for minimization of idling time to no more than five minutes and clear signage for workers of this requirement in compliance with SMAQMD's basic construction emissions control practices.

Comments Received at the Public Webinar

TABLE H-1
COMMENTS FROM THE PUBLIC WEBINAR WITH RESPONSES

Comment Number	Commenter, Organization	Comment	Response
Attendee Chat Space Comments			
W-1	Wilbur Huang, DWR	Q: Slide 14 - Is the planted bench drainable? Will it trap fish if the slope of the bench is sloping toward the levee/bank instead of toward the river?	The planting benches slope towards the channel and downstream as is shown in Figures 2-4 and 2-6, and is described in Section 2.3.3. Receding water would drain off the planting bench toward the channel and fish would not be trapped.
W-2	Liz Bellas, Sacramento County Regional Parks	Q: can this presentation be given to the Sacramento County Recreation and Parks Commission as well?	The presentation was made to the Sacramento County Recreation and Parks Commission on June 25, 2020.
W-3	Mary Maret, Sacramento County Regional Parks	Q: Project 2.1 road closure (to the public) on page 3-145 was for 1.5 years. This seems like a long time to close a facility to the public. Is this a worst case scenario? Are there alternatives to shorten the closure?	See response 4-2.
W-4	Kelly Cohen, Save the American River Association	Q: Will trees be protected from beavers?	Plantings would be protected from beavers using a combination of fencing and strategic placement of species that are not preferred by beavers (e.g., buttonbush and California grape).
W-5	Kelly Cohen, Save the American River Association	Will tree roots affect slope protection as they grow?	The tree roots are not expected to affect slope protection as they grow. The primary planting location for larger trees would be on the planting bench or above the launchable trench at the toe of the slope where tree roots would be unlikely to penetrate rock protection on the slope above them.
W-6	Kelly Cohen, Save the American River Association	Risk of damage from human using slope?	The slope is geotechnically stable with voids between rocks that are filled with sediment. The riprap on the slope will be covered with 1 foot of topsoil and seeded with grass providing additional stability to the rock protection. The risk of damage would be low.

TABLE H-1
COMMENTS FROM THE PUBLIC WEBINAR WITH RESPONSES

Comment Number	Commenter, Organization	Comment	Response
W-7	Kelly Cohen, Save the American River Association	Will change in bank have any affect on opposing bank?	As is stated in Section 3.3.3.2 Hydrology, the Proposed Action would have no significant hydraulic impact. The (less than significant) effect is mainly noticeable by a small increase in flood stage upstream of the H Street Bridge. No substantial effect on the opposite bank (Campus Commons Golf Course) was observed in the hydraulic analysis.
W-8	Kelly Cohen, Save the American River Association	What prevents undercutting of rock slope protection?	The rock slope protection would extend to the channel bottom at the toe of the slope. The revetment on the channel bottom would include an extra volume of rock designed to fall into any eroded space created by channel lowering that could occur as the result of erosion. This design ensures continuous rock protection to the bottom of the slope in existing and any future channel conditions to prevent undercutting.
W-9	Kelly Cohen, Save the American River Association	Q: Just curious… Why did you choose the Rio Americana site for mitigations?	USACE, DWR, and SAFCA worked with the Sacramento County Department of Regional Parks to select these sites, because of their suitability for habitat development and compatibility with other Parkway uses.
W-10	Kelly Cohen, Save the American River Association	Q: Can & Will soil movement from outside project area result in filling?	The river may deposit sediment on the surface of planting benches over time. This is a natural process for which the native mix of plants to be planted at the site is well adapted. Since this is a natural process, it is considered a positive attribute of the design.
W-11	Kelly Cohen, Save the American River Association	Q: Are tree anchors meant to be permanent? If so, what is their life span (so to speak)?	The anchored trees are intended to provide immediate in-stream habitat and cover. Their anchors, will be large buried rocks (“deadmen”) that will be permanent. The anchored trees will be fastened to the deadmen with hemp rope. These ropes will decay over time, however due to expected growth of adjacent vegetation and some expected accretion of soil the dead trees are expected to become immobile even after the hemp rope has decayed. The trees will decay slowly over a timescale of a decade or so, and when they have decayed, their instream habitat function will have been taken over by mature vegetation.
W-12	Kelly Cohen, Save the American River Association	Q: Would you have to then replace the rock that "launched".	See response 4-3.
W-13	Jim Morgan, Save the American River Association/ Butterfield-Riviera East Community Association	More comment than question: I would encourage the Corps etc. to bury the launchable toe of the planting bench design to minimize hydrologic impact, and also for esthetic and recreational concerns.	See response 9-4.

TABLE H-1
COMMENTS FROM THE PUBLIC WEBINAR WITH RESPONSES

Comment Number	Commenter, Organization	Comment	Response
W-14	Kelly Cohen, Save the American River Association	Q: Thank you for answering my slew of questions. Good meeting.	This comment is noted.
Presenter Chat Space Comments (identical comments from the Attendee Chat Space are not repeated)			
W-15	Kate Riley, Private Citizen	1) How many trees will be removed from the Planting Bench for the project. Perhaps a better question would be how many trees, if any, will be retained?	All trees within the erosion protection footprint will be removed. However, the design engineers walked the site with a licensed arborist to adjust the boundaries of the work area, haul route, and staging areas to avoid native trees where feasible. A total of approximately 400 trees will be removed from the site.
W-16	Kate Riley, Private Citizen	2) Are you coordinating with the City of Sacramento's Water Meter installation project? That is going on in River Park May 20 to May 21 with major traffic and construction in River Park and especially the haul routes.	See response 9-2.
W-17	Kate Riley, Private Citizen	3) Are you coordinating with the City on environmental mitigation which will be required for Two Rivers Trail phase II.	See response 10-4.
W-18	Kate Riley, Private Citizen	Glenn Hall Park is a site for mitigation (which I think is great!) the area proposed is subject to a lot of use that is inconsistent with caring for plants in a mitigation environment. How will that be handled? For example, there's a bike ramp situation that kids have developed near the mitigation area.	See response 9-6.
W-19	Kate Riley, Private Citizen	Where would the bike trail go in the planting bench design? would it be where the maintenance road is now?	The Two Rivers Trail Project and the Proposed Action are independent projects. As part of the Proposed Action the maintenance road would be restored to its existing condition.
W-20	Jim Morgan, Save the American River Association/Butterfield-Riviera East Community Association	Comment: would encourage Corps etc. to bury the launchable toe of the planting bench design, to minimize hydrologic impact, and also for esthetic and recreational effects.	See response 9-4.
Verbal Comments (comments that were read from the Chat Space by the facilitator are not repeated)			
W-21	Mark Johnson, Anderson Dragline Inc.	When will this project likely go out to bid?	At this time the specific date that the project would go to bid cannot be provided, and depends on the date that permits will be issued for the project. Contracting opportunities would be advertised on the USACE's web site: sacleveeupgrades.com.

TABLE H-1
COMMENTS FROM THE PUBLIC WEBINAR WITH RESPONSES

Comment Number	Commenter, Organization	Comment	Response
W-22	Betsy Weiland, Save the American River Association	I think this would apply both to the launchable trench and the toe. If it is launched do you plan on rebuilding it?	See response 4-3.
W-23	Betsy Weiland, Save the American River Association	At what CFS do you expect the launchable toe and trench to activate? Can you anticipate that?	It would likely take a flow of at least 115,000 cfs to create conditions for scour to occur. Although at a flow of 115,000 cfs there would be a *probability* that scour would occur, the occurrence of scour would not be certain. It is unlikely that the scour would occur along the entire length of the site.

Appendix I

Revisions to the Draft Supplemental Environmental Assessment/Environmental Impact Report

This appendix presents corrections and revisions made to the Proposed Action's Draft Supplemental Environmental Assessment/Environmental Impact Report (Supplemental EA/EIR). This appendix does not identify administrative changes to the Supplemental EA/EIR text which do not affect the analysis contained in the Supplemental EA/EIR (for example, updates to the public review process). New text is indicated with a double underline and text to be deleted is reflected by a ~~strike through~~. Text changes are presented in the page order in which they appear in the Supplemental EA/EIR.

The changes identified below are clarifications or amplification of the information and analysis contained in the Supplemental EA/EIR. None of the changes identified below results in a significant impact that was not already identified in the Supplemental EA/EIR. Furthermore, none of the impacts identified in the Supplemental EA/EIR were found to be substantially more severe as the result of the following changes. For these reasons, recirculation of the Supplemental EA/EIR is not warranted.

Chapter 2, *Alternatives*

Page 2-7, second paragraph is revised as follows:

> All launchable-rock trenches would be constructed outside of the ~~natural river~~ main channel…

Page 2-25, last paragraph is revised as follows:

> Any staging area would be restored to original pre-existing contour and condition or as agreed to by the property owner. To avoid erosion, staging areas would be hydro seeded and layered with wood mulch to prevent encroachment of invasive species. Any roads or other access areas damaged by construction would be repaired and restored to prior condition. All trash, excess construction materials, and construction equipment would be removed. Impacts to riparian habitat would be avoided to the extent feasible. Any unavoidable impact to riparian habitat would be mitigated off-site at ratios described in Chapter 3.

Page 2-27, Table 2-4 is revised as follows:

TABLE 2-4
ESTIMATED PLANTABLE AREA FOR RELOCATING ELDERBERRY SHRUBS AND ASSOCIATED RIPARIAN VEGETATION

Site	Site Area (acre)	Plantable Area (acre)
Glenn Hall Park (RM 4.9 L)	~~10.41~~ 9.84	~~7.38~~ 5.03
Rio Americano West (RM 10.4 R)	~~5.39~~ 7.77	~~3.38~~ 3.32
Rio Americano East (RM 11.1 R)	~~2.44~~ 3.40	~~2.12~~ 2.12
TOTAL	~~18.24~~ 21.01	~~12.88~~ 10.47

The following text is inserted below Table 2-4 on page 2-27:

These mitigation sites were chosen because they were considered suitable for supporting riparian habitat and elderberry shrubs, and because of their limited existing habitat quality. Glenn Hall Park is dominated mostly by non-native woodland with areas of non-native grassland, native scrub, and native woodland. Rio Americano West is a mix of non-native grassland and native woodland with minor components of non-native woodland and native scrub. Rio Americano East consists mostly of non-native grassland with some native scrub and small patches of native and non-native woodlands.

Chapter 3, *Affected Environment and Environmental Consequences*

Page 3-32, the first paragraph is revised as follows:

To mitigate these impacts, USACE would create a total of 20.8~~4~~6 acres of riparian habitat, which would include 12.8~~4~~6 acres of on-site riparian habitat in the Permanent Project Area. In addition, 8.~~1~~00 acres of off-site riparian habitat would be created (see Section 3.6, *Special Status Species*).

Page 3-33, the fourth paragraph is revised as follows:

Riparian woodland present within Subreach 2 is considered a sensitive natural community. However, because a total of 12.8~~4~~6 acres would be created on-site and 8.~~1~~00 acres would be created off-site to address impacts on VELB and western yellow-billed cuckoo habitat at a 3:1 and 2:1 ratio, respectively, the Proposed Action would result in a net increase in riparian woodland acreage within and near the Project Area. State and Federally protected wetlands and other jurisdictional waters are also considered to be protected sensitive natural communities. Of the impacted riparian habitat 5.51 acres is located below the OHWM (18,500 cfs water level) and is considered forested wetland. Based on the design of the Proposed Action, this riparian wetland would be replaced with 7.59 acre of riparian habitat located below the OHWM (Table 3.4-2). ~~In addition, the 8.10 acres of~~ Additional off-site riparian habitat would be created at a mitigation site in the American River Parkway that would be selected and designed in coordination with NMFS and USFWS as part of the consultation under the Endangered Species Act and that would be located below the OHWM (See SRA-1 for additional discussion). In addition, 0.12 acre of emergent wetland is proposed to be constructed at the Project Area.

Page 3-37, the fourth paragraph is revised as follows:

In summary, to address the impacts on the 10.43 acres of riparian habitat (including forested wetland below OHWM) that would be affected by construction of the Proposed Action, replacement riparian habitat would be created, including 12.8~~4~~6 acres on site and 8.~~1~~00 acres off site. Implementing this compensatory mitigation would reduce long-term impacts on any natural community or wildlife habitat within the Project Area to a less-than-significant level by creating on-site and off-site riparian habitat.

Page 3-63, first paragraph under Western Yellow-Billed Cuckoo

> There has been only one recent incidental vocal detection upstream of the Project Area, on a densely vegetated island in the river (see Section 3.6.2 above). Construction of Site 2-1 would result in the loss of 10.43 acres of riparian habitat (**Table ~~3.6-3~~ 3.4-2**). This loss of habitat would be a significant impact.

Page 3-111, the last paragraph is revised as follows:

> In addition, if modeled construction-generated emissions for a project are not reduced to less than SMAQMD's mass emission threshold (85 pounds per day [lb/day]) after the standard construction mitigation is applied, then SMAQMD recommends charging an off-site construction mitigation fee. The fee must be paid before a grading permit can be issued. This fee is charged by SMAQMD to ~~purchase off-site emissions reductions~~ fund emission reduction programs. ~~Such purchases are made through~~ One example is SMAQMD's Heavy Duty Incentive Program, through which select owners of heavy-duty equipment in Sacramento County can repower or retrofit their old engines with cleaner engines or technologies.

Page 3-113, paragraph one is revised as follows:

> The types of construction activities that would generate emissions of air pollutants include clearing of trees, vegetation, and loose materials; degrading and excavating the levee; installation of rock revetment; construction of a launchable-rock-filled trench; reconstruction of the levee; associated worker haul and commute trips; and implementation of mitigation sites. Refer to **Appendix ~~D~~ E** for all inputs, assumptions, and modeling results. Specific methods are described herein. Where significant air quality impacts are identified, mitigation measures to reduce these impacts are specified.

Text in Table 3.9-1 on page 3-116 is revised as follows:

TABLE 3.9-1
ARCF 2016 PROJECT, AMERICAN RIVER CONTRACT 1 CONSTRUCTION EMISSIONS

Maximum Construction Activity	Maximum Daily Emissions (lb/day)[1]				
	ROG	NO_X	CO	PM_{10}	$PM_{2.5}$
2021 (Site 2-1 + Mitigation Sites)	9	194	92	32	5
CEQA Threshold	N/A	85	N/A	0[2]	0[2]
Exceed Threshold?	N/A	Yes	N/A	~~No~~ Yes	~~No~~ Yes

NOTES:

1 Estimates represent a worst-case construction conditions which was assumed to be from May to July 2021. For annual emissions and a comparison to Federal *de minimis* levels, see Appendix ~~E~~ F.

2 SMAQMD has a zero pound per day threshold of PM, when best available controls are not implemented but threshold with incorporated controls are 80 lb/day for PM_{10} and 82 lb/day for $PM_{2.5}$

SOURCE: Modeling conducted by Ascent Environmental in 2020.

On page 3-117, the first paragraph is revised as follows:

As shown in Table 3.9-1, construction-related emissions under the Proposed Action, which included reductions associated with project commitments of higher tiered engines, would exceed SMAQMD's mass daily emission threshold for NO_X, PM_{10}, and $PM_{2.5}$. ~~Although mitigation measures recommended by SMAQMD would reduce NO_X in off-road equipment by 10 percent, construction-related emissions of NO_X would still exceed the threshold.~~ USACE would be required to pay an off-site mitigation fee for NO_X emissions to reduce the impact to a less-than-significant level.

Mitigation measure AQ-3 on page 3-120 is revised as follows:

Mitigation Measure AQ-3: Develop and Implement a Plan for Enhanced On-Site Exhaust Controls. Actual emissions of nonattainment and maintenance pollutants would be tracked monthly using tools acceptable to SMAQMD (e.g., construction mitigation calculator, SMAQMD's Equipment List). USACE shall submit to SMAQMD a comprehensive inventory of all off-road construction equipment ~~USACE would provide a plan for approval by SMAQMD demonstrating that the heavy-duty off-road vehicles~~ (50 horsepower or more) to be used 8 hours or more during project construction. ~~would achieve a project-wide fleet-average 10 percent NO_X reduction compared to the most recent California Air Resources Board (CARB) fleet average. The plan would have two components: an initial report submitted before construction and a final report submitted at the completion of construction.~~ The tracking data would be used to verify that all pollutants remain below the CEQA daily thresholds, General Conformity de minimis thresholds, or are fully mitigated and offset if emissions exceed either.

~~The initial report would be submitted at least 4 business days prior to construction activity using SMAQMD's Construction Mitigation Tool (http://www.airquality.org/businesses/ceqa-land-use-planning/mitigation).~~ The initial report would include all of the following details:

- Information about the project information and the construction company.
- The equipment type, horsepower rating, engine model year, projected hours of use, and CARB equipment identification number for each piece of equipment in the plan.
- All owned, leased, and subcontracted equipment to be used.

~~The final~~ Updated reports would be submitted monthly ~~at the end of the job, phase, or calendar year, as pre-arranged with SMAQMD staff and documented in the approval letter~~, to demonstrate continued project compliance.

SMAQMD may conduct periodic site inspections to determine compliance. Nothing in this mitigation would supersede other air district, State, or Federal rules or regulations.

Mitigation measure AQ-4 on page 3-119 is revised as follows:

> **Mitigation Measure AQ-4: Use Electric Construction Equipment.**
> To the extent available and feasible, c~~C~~onstruction equipment would be powered by electricity, rather than diesel fuel, to reduce construction-related criteria air ~~eliminate emissions of criteria~~ pollutants, TACs, and tailpipe greenhouse gas emissions associated with ~~from~~ diesel combustion. Electrification would result in a small amount of indirect carbon dioxide emissions because of the operation of the electric grid. Various types of construction equipment may feasibly be run on electricity.

Page 3-127, second full paragraph is revised as follows:

> The emission factors and models described there were also used to quantify GHG emissions. GHG emissions were summed over the entire duration of all anticipated activity, including the use of heavy-duty equipment, haul trucks, and worker commute trips. All inputs and assumptions are included in Appendix ~~D~~ E.

Page 3-127, the sixth full paragraph is revised as follows:

> SMAQMD has local jurisdiction over the Project Area. On October 23, 2014, the SMAQMD adopted GHG thresholds, which were informed ~~In January 2008, SMAQMD made a resolution to adopt guidance published~~ by the California Air Pollution Control Officers Association, ~~entitled~~ "CEQA and Climate Change, Evaluating and Addressing Greenhouse Gas Emissions from Projects Subject to the California Environmental Quality Act~~.~~" document.[80] ~~This resolution adopted the following recommended GHG thresholds of significance:~~ The SMAQMD-adopted thresholds are: …

Page 3-145, the fifth paragraph has been revised as follows:

> Advance notice would be given to recreation users, informing them of anticipated activities and detours to reduce the effects. Closures of paved trails would be noticed 14-days in advance via signage at the detour locations.

Appendix J
Public Involvement

This appendix provides information on public involvement for the Draft Supplemental EA/EIR. The Draft Supplemental EA/EIR was circulated on June 5, 2020 for a 45-day public review period ending on July 20, 2020. A notice of availability was published in the Federal Register and the Sacramento Bee on June 5, 2020. An electronic version of the document was posted to the USACE website and hard copies were made available by request to the public.

USACE posted information about the Proposed Action on its website at www.sacleveeupgrades.com, which included summarized information on the Proposed Action, an electronic copy of the Draft Supplemental EA/EIR, a Frequently Asked Questions document prepared by the local sponsor for the project, and instructions as to how to participate in the virtual public meeting held on June 15, 2020. The website was subsequently updated to include the presentation slides used during the public meeting.

A robust public outreach was conducted about the nature and location of the proposed erosion work associated with this draft supplemental document. The neighborhoods directly adjacent to future erosion work and along the proposed haul routes were noticed about the public meeting and where to send comments. A total of 3,444 direct mail notices were sent. The notices contained summary information about the Proposed Action, information about the virtual public meeting, and included a link to the USACE website. A Notice of Availability was sent to 162 interested parties, public agencies, and elected officials regarding the publication of the Draft Supplemental EA/EIR and the virtual public meeting.

A total of 41 people attended the virtual public meeting, comments were solicited during the meeting and responded to in Appendix H of this Final Supplemental EA/EIR.

A total of 23 comments were received during the public meeting. In addition, a total of 69 comments were received by letter and email on the Draft Supplemental EA/EIR. Letters and responses are included in Appendix H of this Final Supplemental EA/EIR.
