910 Hampshire Road, Suite V
Westlake Village, California 91361

November 2016

PURPOSE

This Air Quality and Greenhouse Gas Technical Report was prepared to support the CEQA evaluation of a proposed residence. The Project Site is within the Hollywood Community Plan area and the Bel Air – Beverly Crest neighborhood of the City of Los Angeles. The Project involves the construction of a new 2-story, 8,976-square-foot single-family residence with attached 1,107-square-foot 4-car garage and 8,611 square feet of basement space.

This report describes the existing framework and methodology used to estimate emissions associated with the Project and includes the model data output sheets.

FRAMEWORK

Air Quality Pollutants

Title I of the federal Clean Air Act (CAA) identifies attainment, nonattainment, and unclassifiable areas with regard to the criteria pollutants, and sets deadlines for all areas to reach attainment for criteria pollutants. The USEPA has set National Ambient Air Quality Standards (NAAQS) and also designates air basins as achieving “attainment” or suffering from “nonattainment” of the standards.

The California Clean Air Act requires all areas of the state to achieve and maintain the California Ambient Air Quality Standards (CAAQS) by the earliest practicable date. The California Air Resources Board (CARB) sets the CAAQS for each of the criteria pollutants. In general, the CAAQS are more restrictive than the NAAQS.

California is divided into air districts which are the regional governing authorities with primary responsibility for controlling air pollution from stationary sources. Los Angeles is within the South Coast Air Quality Management District (SCAQMD). SCAQMD has established thresholds and methodology for evaluating the significance of emissions of criteria pollutants.

The criteria pollutants are described below.

Ozone

Ozone (O_3) is a gas formed when volatile organic compounds (VOCs) and oxides of nitrogen (NO_x), both byproducts of internal combustion engine exhaust and other sources, undergo slow photochemical reactions in the presence of sunlight. Ozone concentrations are generally highest during the summer months, when direct sunlight, light wind, and warm temperature conditions are favorable to the formation of this pollutant.

Respirable Particulate Matter (PM10)

Respirable particulate matter (PM10) consists of extremely small, suspended particles or droplets 10 micrometers (μm) or smaller in diameter. Some sources of PM10, like pollen and windstorms, are naturally occurring. However, in populated areas, most PM10 is caused by road dust, diesel soot, combustion products, the abrasion of tires and brakes, and construction activities.

Fine Particulate Matter (PM2.5)

PM2.5 refers to fine particulate matter that is 2.5 μm or smaller in size. The sources of PM2.5 include fuel combustion from automobiles, power plants, wood burning, industrial processes, and diesel-powered vehicles such as buses and trucks. These fine particles are also formed in the atmosphere when gases such as SO₂, NO_x, and VOCs are transformed in the air by chemical reactions.

Carbon Monoxide (CO)

Carbon monoxide (CO) is a colorless, odorless gas produced by the incomplete combustion of fuels. CO concentrations tend to be the highest during winter mornings with little to no wind, when surface-based inversions trap the pollutant at ground levels. Because CO is emitted directly from internal combustion engines, unlike ozone, and because motor vehicles operating at slow speeds are the primary source of CO in the basin, the highest ambient CO concentrations are generally found near congested transportation corridors and intersections.

Nitrogen Dioxide (NO₂)

Nitrogen dioxide (NO₂) is a reddish-brown, highly reactive gas that is formed in the ambient air through the oxidation of nitric oxide (NO). NO₂ is also a byproduct of fuel combustion. The principle form of NO₂ produced by combustion is NO, but NO reacts quickly to form NO₂, creating the mixture of NO and NO₂ referred to as oxides of nitrogen (NO_x). NO₂ acts as an acute irritant and, in equal concentrations, is more injurious than NO. At atmospheric concentrations, however, NO_x is only potentially irritating. NO₂ absorbs blue light, the result of which is a brownish-red cast to the atmosphere and reduced visibility.

Sulfur Dioxide (SO₂)

Sulfur Dioxide (SO₂) is a colorless, extremely irritating gas or liquid. It enters the atmosphere as a pollutant mainly as a result of the burning of high-sulfur-content fuel oils and coal and from chemical processes occurring at chemical plants and refineries. When SO₂ oxidizes in the atmosphere, it forms sulfates (SO₄).

Greenhouse Gases

Greenhouse gases (GHGs) are gases that trap heat in the atmosphere in a way that is analogous to how a greenhouse functions. Common GHGs include water vapor, carbon dioxide (CO₂), methane (CH₄), nitrous oxides, chlorofluorocarbons, hydrofluorocarbons, perfluorocarbons, sulfur hexafluoride, ozone, and aerosols. Both natural processes and human activities emit GHGs. Emissions from human activities, such as electricity production and vehicle use, have elevated concentration of these gases in the atmosphere beyond the level of naturally occurring concentrations. The presence of these GHGs in the atmosphere affects the earth's temperature by retaining heat.

In September 2006, Governor Schwarzenegger signed California's Global Warming Solutions Act of 2006 (AB32) that requires CARB to establish statewide GHG emissions cap for 2020 based on 1990 emissions. As such, evaluating GHG emissions has become part of the CEQA process. The SCAQMD has provided guidance to determining significance of GHG emissions.

EMISSIONS MODELING

Emissions of air pollutants and GHGs were estimated for construction and operation of the Project using the California Emission Estimator Model (CalEEMod). CalEEMod is a computer model developed by the California Air Pollution Control Officer's Association (CAPCOA) in collaboration with the California Air Districts and is the recommended methodology by SCAQMD. CalEEMod relies on project-specific information pertaining to geographic setting, utility service, construction scheduling, equipment inventory, and operational design features to generate estimates of air pollutants and GHG emissions. The model quantifies direct emissions from construction and operation activities (including vehicle use), as well as indirect emissions, such as GHG emissions from energy use, solid waste disposal, vegetation planting and/or removal, and water use.

The resulting calculations of maximum daily emissions are shown in the attached model output pages. Within the CalEEMod terminology, "Mitigated Construction" refers to compliance with SCAQMD rules. It is assumed that Project construction would abide by these rules.

For construction emissions, the highest value from mitigated onsite construction output tables for each phases of construction for each season (Winter, Summer) is used. For operational values, the highest values from each seasonal output are used. Predicted GHG emissions are derived from the Annual project output. The current accepted method for accounting for construction GHG emissions within the SCAQMD service area is to annualize these emissions over a project's operational lifetime, generally defined as 30 years for analysis purposes.

Blue Heights Residence - South Coast Air Basin, Annual

1.3 User Entered Comments & Non-Default Data

Blue Heights Residence - South Coast Air Basin, Annual

Project Characteristics -

Land Use - Lot coverage = 14,316 sq. ft.

Lot area = 37,056 sq. ft.

Construction Phase - Export during grading would be limited to 12 truck trips per day with a capacity of 10 cubic yards per truck

Off-road Equipment - No cranes

Grading - 9,586 cy of soil exported off-site

Trips and VMT - Grading will last approximately 80 days, with 12 truck trips per day with a capacity of 10 cy.

Export taken to Scholl Canyon Landfill, 40 miles roundtrip

Woodstoves - No woodstoves

Construction Off-road Equipment Mitigation - Per CARB Title 13 CCR Section 2520-2427, equipment required to be Tier 4 Final for new equipment. For conservative analysis, equipment set to Tier 2.

1.3 User Entered Comments & Non-Default Data

Blue Heights Residence - South Coast Air Basin, Summer

Project Characteristics -

Land Use - Lot coverage = 14,316 sq. ft.

Lot area = 37,056 sq. ft.

Construction Phase - Export during grading would be limited to 12 truck trips per day with a capacity of 10 cubic yards per truck

Off-road Equipment - No cranes

Grading - 9,586 cy of soil exported off-site

Trips and VMT - Grading will last approximately 80 days, with 12 truck trips per day with a capacity of 10 cy.

Export taken to Scholl Canyon Landfill, 40 miles roundtrip

Woodstoves - No woodstoves

Construction Off-road Equipment Mitigation - Per CARB Title 13 CCR Section 2520-2427, equipment required to be Tier 4 Final for new equipment. For conservative analysis, equipment set to Tier 2.

1.3 User Entered Comments & Non-Default Data

Blue Heights Residence - South Coast Air Basin, Winter

Project Characteristics -

Land Use - Lot coverage = 14,316 sq. ft.

Lot area = 37,056 sq. ft.

Construction Phase - Export during grading would be limited to 12 truck trips per day with a capacity of 10 cubic yards per truck

Off-road Equipment - No cranes

Grading - 9,586 cy of soil exported off-site

Trips and VMT - Grading will last approximately 80 days, with 12 truck trips per day with a capacity of 10 cy.

Export taken to Scholl Canyon Landfill, 40 miles roundtrip

Woodstoves - No woodstoves

Construction Off-road Equipment Mitigation - Per CARB Title 13 CCR Section 2520-2427, equipment required to be Tier 4 Final for new equipment. For conservative analysis, equipment set to Tier 2.

Area Mitigation -

Water Mitigation -
